FitHer build list: final

How this list works

- **Three deliveries, in this order.** The list has three parts, each in three modules, one module per delivery: Nutrition and hormones (36), Movement (26) and Platform and growth (28). The condition and life stage modules (8) come after them in Delivery 3. 98 features in total, plus 7 foundations and 7 check and optimize items that open Delivery 1. Delivery 1 holds those 7 check items, the 7 foundations and Module 1 of each part (36), 50 in all. Delivery 2 holds Module 2 (32), and Delivery 3 holds Module 3 and the condition modules (30). The 14 features that are already live are at the end.
- **How the parts are laid out.** Every module works on its own and sets up the next, so each delivery gives her something complete. The three parts sit one after another, then the condition modules, which need all three. Features the brief marks as across all areas sit in the part they serve most.
- **Priority 1 is first, inside every module.** Order is set by: (1) unblocks other features, (2) daily value to her and reason to pay for Plus, (3) low cost to run, (4) fit with the goal of the brief: hormone intelligence first, and software or AI that scales without more trainers or dietitians.
- **IDs read like this:** 2NH1 is Nutrition and hormones, Module 2 (Delivery 2), priority 1. 1A1 is the first check and optimize item in Delivery 1, and X1 to X8 are the foundations it needs. The ID 2P3 is not used because that feature moved into 1A1. M is Movement and P is Platform and growth. The Needs first column names what has to exist before a feature can be finished.

The three deliveries at a glance

	Nutrition and hormones	Condition and life stage modules	Movement	Platform and growth
Start of Delivery 1 **Check and optimize what is live** 7 items	**1A1** Dashboard and event tracking, complete **1A2** Payment flow and journey to payment, audit and fixes **1A3** User flow audit and fixes **1A4** Performance and capacity check **1A5** Upsell options audit and fixes **1A6** Engagement options audit and fixes **1A7** User journey optimization			
Delivery 1 foundations **Needed before the features** 7 items	**X1** Exercise list with tags **X2** Live class tags **X3** Workout player with mark done **X4** Tier counters and checks **X5** Video hosting and upload tools **X7** Missed session sheet with an action button, and correct session data **X8** Animated exercise clips			

	Nutrition and hormones	Condition and life stage modules	Movement	Platform and growth
Delivery 1 **Module 1 of each part** 36 features	**1NH1** Symptom logging, basic (daily) **1NH2** Quick daily check in (mood, energy, stress, sleep) **1NH3** Energy logging **1NH4** Stress logging **1NH5** Sleep logging **1NH6** Water intake logging **1NH7** Pakistani food database **1NH8** AI meal photo logging, capped (Free) **1NH9** Edit and correct a logged meal **1NH10** Unlimited AI meal photo logging (Plus) **1NH11** Behavior based signal capture **1NH12** Luna, your daily body advisor (personalized AI phase insights) **1NH13** Phase based nudge notifications **1NH14** Daily phase message (Free) **1NH15** Smart log reminders		**1M1** Injury and limitation filter **1M2** Phase adaptive workout intensity **1M3** Animated guided workouts **1M4** Voice and written form cues **1M5** Post workout feedback **1M6** Basic streaks and milestone badges	**1P1** AI first pass community moderation **1P2** Approved content library and review queue **1P3** AI sales and support assistant **1P4** Report, block and anonymous posting **1P5** Payment slip upload fix and clear payment states **1P6** Faster plan activation (instant payment method) **1P7** Clearer plan page and paywall **1P8** Free trial and first week flow **1P9** Upgrade moments (smart upsell prompts) **1P10** Home screen with one daily focus **1P11** Fix wrong and broken screen details **1P12** Personal first week **1P13** Renewals, freeze and win back **1P14** Trust basics: privacy notice and hidden admin login **1P15** Smaller, faster app
Delivery 2 **Module 2 of each part** 32 features	**2NH1** Food preferences and allergies filter **2NH2** Phase aware food scoring on meal photos **2NH3** Automatic weekly diet plan adjustment **2NH4** AI grocery list with phase aware swaps **2NH5** Appetite and cravings logging **2NH6** Digestion logging **2NH7** Medications and supplements logging **2NH8** Period flow and spotting logging **2NH9** Skin and hair logging **2NH10** Weekly symptom pattern report **2NH11** Weekly progress summary **2NH12** Doctor ready PDF export **2NH13** Monthly nutrition and body report **2NH14** Period predictor: what to expect and when		**2M1** Time and energy picker **2M2** Swap this exercise **2M3** Auto progression **2M4** Rest day suggestion **2M5** Missed session recovery workout **2M6** Today’s plan card **2M7** Enhanced streaks **2M8** Fuel tips around workouts **2M9** Women specific basic sets **2M10** Progress photo timeline **2M11** Milestone sharing **2M12** Cast to TV	**2P1** AI content poster **2P2** AI community manager **2P4** AI cost monitor **2P5** Remote controls **2P6** Referral program **2P7** Community streak visibility

	Nutrition and hormones	Condition and life stage modules	Movement	Platform and growth
Delivery 3 **Module 3 of each part, then the condition modules** 30 features	**3NH1** AI nutritionist **3NH2** Ramadan mode **3NH3** Daily note **3NH4** Tone and style personalization **3NH5** Cycle calendar with a plan ahead **3NH6** Gentle red flag guidance **3NH7** Lab report upload	**3H1** Condition modules framework (module engine) **3H2** PCOS module **3H3** Postpartum module **3H4** Thyroid module **3H5** Endometriosis module **3H8** PMS and PMDD module **3H9** Perimenopause module **3H11** Trying to conceive module	**3M1** Recorded class library **3M2** Trainer style filter **3M3** Full recorded library (Unlimited) **3M4** Micro sessions **3M5** Live class replays in the library **3M6** Four week programs **3M7** Low data and download mode **3M8** Favourites and continue watching	**3P1** Privacy lock and discreet mode **3P2** Urdu and Roman Urdu **3P3** Health Connect sync **3P4** Gift a subscription and mother and daughter plan **3P5** Group plans for companies, workplaces and universities **3P6** Points for streaks **3P7** Free website tools

Start of Delivery 1. Check and optimize what is live (7)

Goal: everything about checking and optimizing the live app happens inside Delivery 1, so nothing in this section waits for Delivery 2. Each item has an audit, the fixes, and a written result. The agency fixes anything that blocks sign up or money, fails at the agreed peak, or breaks a flow in this delivery, and the rest goes on a ranked list. Tracking comes first so every other item is measured. These seven are checks and fixes, not new features, so the status is To check. The founder dashboard that was in Delivery 2 is now part of 1A1. Where a known fix already has its own row below (1NH15, 1P5 to 1P15), the audit tests it and fills gaps, and nothing is built twice.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1A1	**Dashboard and event tracking, complete**	All tiers	**To check**	Audit. List what the admin dashboard and the current analytics (Mixpanel) track today, which numbers are wrong or missing, and whether revenue matches the payment records. Build. One event schema across app and server: install, signup, each onboarding step, first log, first workout, paywall view, upgrade tap, payment success, payment failure, cancel, freeze, refund, push received and opened, session start and length, crash. One founder dashboard in the admin area, founders only. Sections: users (signups, daily, weekly and monthly active), funnel (install to signup to onboarding done to first log to first workout to first payment), money (revenue by tier and by day, renewals, churn, refunds, failed payments, revenue per user), retention (weekly cohorts), usage (logs, workouts, community posts, features opened), AI cost per feature and per user, support (tickets, response time, assistant handoffs), plan mix. Filters by date, tier and platform. CSV export. An email alert when payment failures or crashes spike. Done when. Every metric above shows on the dashboard from a tracked event and matches the payment records for one full test week. Nothing is left for a later delivery.	Decision on the analytics tool, existing or new	Behind the scenes. Founders see every number in one place from day one, and every other item in this section is measured with it.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1A2	**Payment flow and journey to payment, audit and fixes**	All tiers	**To check**	Audit. Test every path on each tier: card, bank transfer, local wallets if used, and slip upload with its approval step and the status the user sees while waiting. Cover first purchase, renewal, expiry, upgrade, downgrade, freeze, the 1 day full refund, failed and pending payments, duplicate taps and duplicate charges. Check webhook handling and retries, receipts, price and currency display, test mode against live mode, and that no card data is stored in the app. The payment slip bug (P-01) is already known. Journey to payment. Map every route a user takes to the pay screen: the plan page from the menu, the end of the trial, a locked feature, the photo cap and a renewal reminder. For each route, count the screens, taps and minutes from the first prompt to a confirmed payment, using the 1A1 funnel: paywall view, plan chosen, method chosen, payment sent, payment confirmed, plan active. Record where users drop off and why, for a new user and for a renewing one. Optimize. Cut each route to the fewest steps. Open on the plan she was already viewing, remember her last plan and method, take her from any prompt straight into the chosen plan, show the total price and what happens next on the same screen, let her resume an unfinished payment, and remind her once if she leaves halfway. Agree a target number of screens with the founders. Test each change with a feature flag or an A/B split, keep what wins and roll back what does not. Fix. Everything that loses money, double charges or leaves a user stuck is fixed inside this delivery. Anything else goes on a ranked list. Known fixes have their own rows: the slip bug (P-01) is 1P5 and instant payment is 1P6. This audit tests them and finds the rest. Done when. Written findings are delivered, every path has passed on each tier, and there is no open issue that loses or double charges money. A journey map with the step count and drop off at each step is delivered, and each of the top drop offs has a shipped fix or a finished test, with before and after numbers on the dashboard.	Test accounts and payment gateway access	Behind the scenes. A failed or lost payment is lost revenue and trust, and every upsell below depends on this path working.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1A3	**User flow audit and fixes**	All tiers	**To check**	Audit. Click through every flow as a new and a returning user: signup, login and password reset, onboarding questions, permission asks, home, booking and joining a live class, dietitian booking, community, tier gates, settings, logout and delete account. Test on low end Android, recent Android and iPhone, on a weak connection and offline. Record crashes, dead ends, slow screens, broken states and unclear copy. Add a funnel event to each step so drop off is measured per screen. Fix. Severity 1 and 2 issues are fixed inside this delivery. The rest goes on a ranked list. Screen problems already found in the UI review are in 1P10 and 1P11. This audit finds the rest and measures drop off per screen. Done when. The flow map and bug list are delivered, severity 1 and 2 issues are closed, and every onboarding and tier gate screen sends a funnel event.	1A1 funnel events	Behind the scenes. Users who get stuck leave before they see any value, so this comes before new work.
1A4	**Performance and capacity check**	All tiers	**To check**	Audit. Measure cold start time, screen load times, API response times, crash free sessions, app size and memory use on a low end phone. Load test the live class join at peak, using the 9 daily slots, and the login and payment paths at several times today's traffic. Check database indexes, caching, push delivery rate, crash and error reporting, and backups. Fix. Anything that fails at the agreed peak is fixed inside this delivery. Agree the peak number with the founders first. The app size fix is 1P15. This audit measures it and the rest of the performance numbers. Done when. A report with measured numbers is delivered, the agreed peak passes without errors, and crash and error reporting is switched on and visible on the dashboard.	Access to crash and error reporting; an agreed peak user number	Behind the scenes. The app stays fast and up as users grow, and ad spend is not wasted on a slow app.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1A5	**Upsell options audit and fixes**	Free, Plus	**To check**	Audit. Map every place a user meets a paywall or upgrade prompt, and every place one is missing: end of the free Plus trial, limit reached (photo log cap), locked insight teaser, locked workout, plan expiry and renewal reminder. Review the pricing and compare tiers screen, price wording, and the steps from tap to paid. Build. Add the missing triggers behind feature flags, one tap upgrade into the payment flow, a compare tiers screen, and a renewal reminder before expiry. Founders can approve extras such as an annual plan or a discount code, which would then be tested as a flag. The plan page, trial and upgrade prompts are specified in 1P7, 1P8 and 1P9, and renewal reminders in 1P13. This audit checks them and fills any gaps, so nothing is built twice. Done when. Every paywall and upgrade moment is mapped, the missing triggers are live behind flags, and views, taps and conversions for each show on the dashboard.	1A1 tracking, 1A2 payment fixes. Runs on the current tiers and prices; changes later are settings	More upgrades from users who already like the app. It is the cheapest revenue we have.
1A6	**Engagement options audit and fixes**	All tiers	**To check**	Audit. List every push, in app message, reminder, streak and empty state that is live. Check timing, the permission ask, frequency caps, quiet hours and opt out. Segment users as new, active, slipping and lapsed, and check what each segment receives. Review the cancel and freeze screens and whether a reason is captured. Build. Fill the gaps: day 1, 3, 7 and 30 comeback messages, missed log nudge, streak at risk, weekly summary prompt, a win back message for lapsed users, and a cancel reason question with an offer to freeze instead. Phase nudges (1NH13) and streaks (1M6) plug into this. Log reminders are 1NH15 and renewals, freeze and win back are 1P13. This audit checks them and fills any gaps, so nothing is built twice. Done when. The message map is delivered, caps and quiet hours are enforced, and each message sends on schedule with opens shown on the dashboard.	1A1 tracking	Behind the scenes. Keeps her coming back without feeling spammed, which protects retention.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1A7	**User journey optimization**	All tiers	**To check**	Audit. Map the journey from install to day 30. Define activation, for example first log plus first workout within 3 days. Measure time to first value and the share of users who reach each step, from the 1A1 funnel. Build. Cut onboarding steps that feed no feature. Rank drop off points and fix the top five. Test each change with a feature flag or an A/B split inside the delivery, keep what wins and roll back what does not. The first week experience is 1P12. This audit measures it and ranks what to fix next. Done when. Activation is defined and tracked, each of the top five drop offs has a shipped fix or a finished test, and a one page journey map shows before and after numbers.	1A1, 1A3 and the fixes from 1A5 and 1A6	She reaches the useful part of the app faster, and more of the people we pay to reach stay.

Order that works: tracking and the dashboard (1A1), then the payment flow (1A2), user flows (1A3) and the performance check (1A4). Upsell (1A5) and engagement (1A6) follow, because they need the payment fixes and tracking. Journey optimization (1A7) comes last because it uses the numbers the others collect.

Delivery 1 foundations (7)

Goal: the shared pieces that Movement, payments and the photo limit need before they can be finished. They are not in the agency brief, so Part 5 of the brief says they are out of scope until confirmed in writing. They are part of Delivery 1.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
X1	**Exercise list with tags**	Behind the scenes	**To build**	A vetted list of exercises, each tagged by body area, impact, equipment, intensity (with easier and harder versions), phase suitability and cautions, with a short how to. Content more than code. Needed by. 1M1, 1M3, 1M4, 2M5, 2M3, 2M2, 2M9, and the movement rules of 3H5 and 3H3 Ready by. Start of Delivery 1 Done when. The first set of core moves is in the list, each fully tagged and reviewed by a trainer, and the app can filter by tag.	Nothing; trainer review of the list	Behind the scenes. Guided workouts, the injury filter and swaps all read these tags.
X2	**Live class tags**	Behind the scenes	**Partly built**	Tag every live class by type, intensity, body focus, impact and trainer style. Intensity tags already exist. Needed by. 1M1, 1M2, 2M5, 3M2, 3M1 Ready by. Delivery 1 Done when. Every live class carries all the tags and the schedule can filter by them.	Nothing	Behind the scenes. Lets the injury filter and the intensity rule cover live classes.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
X3	**Workout player with mark done**	Plus	**To build**	Plays a guided workout step by step: the animated clip, a rest timer and the voice cue, and lets her mark exercises done. Live classes run through the live class system, so this is new. Needed by. 1M3, 1M4, 2M3, 2M1, 1M5, streaks and the weekly summary Ready by. Delivery 1, with 1M3 Done when. A guided workout plays step by step with the clip, rest timer and voice cue, and she can mark each exercise done.	Animated exercise clips (X8); Exercise list with tags (X1)	She sees it. It is how she follows a guided workout and marks each move done.
X4	**Tier counters and checks**	Behind the scenes	**Partly built**	Gating for Free, Plus, Active and Unlimited, a monthly session counter, renewal date and freeze handling. Access is on or off by plan today. The upgrade prompt also needs the payment path to work (agency item P-01). Needed by. 3M1, 3M3, 3P4, the photo cap (1NH8), upgrade moments (1P9), trial (1P8), renewals (1P13), and Plus gating across the app Ready by. Delivery 1 Done when. Access, monthly counters, renewal date and freeze are enforced for each tier from settings, and checked on a test account for every tier.	Working payment path (1P5)	Behind the scenes. Makes tier access, caps, counters and upgrade prompts work.
X5	**Video hosting and upload tools**	Behind the scenes	**To build**	Stream recorded classes and the animated clips instead of bundling videos in the app, which is already 570 MB, plus admin tools to upload and tag classes. Needed by. 1M3, 3M1, 3M3, 3M4, 3M5, 3M7 Ready by. Before 1M3 Done when. Clips and classes stream from the host with no videos bundled in the app, and an admin can upload and tag a class.	Nothing	Behind the scenes. Keeps the app small and lets clips and classes be added without an app release.
X7	**Missed session sheet with an action button, and correct session data**	All tiers	**To build**	Agency items F-01 and F-02. The agency plan schedules F-01 on Day 8 and F-02 on Day 13, so the stale session bug is fixed after the button that depends on it. Add Join next and Find similar to the sheet in Delivery 1. The recovery workout (2M5) follows in Delivery 2. Needed by. 2M5, 1P13 Ready by. Delivery 1, fix F-02 first or together Done when. The missed session sheet shows the right session with Join next and Find similar actions.	Nothing; fix F-02 first or together	She sees it. A missed class leads to a next step instead of a dead end.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
X8	**Animated exercise clips**	Plus	**To build**	A stylised female figure in modest clothing performs each move in a short loop. Each move is animated once (I suggest 40 to 60 core moves to start), checked by a trainer for correct form, and stored on the video host. Not generated per user. Needed by. 1M3, 1M4, 2M9 Ready by. Before 1M3 Done when. The first 40 to 60 core moves are animated, form checked by a trainer and live on the video host.	Exercise list with tags (X1); Video hosting (X5)	She sees it. A trainer on screen shows each move correctly. Get a quote per exercise first.

Order that works: the exercise list (X1), class tags (X2) and video hosting (X5) first, then the animated clips (X8) and the workout player (X3). Tier counters (X4) start early, because the photo limit and upgrade prompts need them. The missed session sheet (X7) runs in parallel.

Nutrition and hormones, in three modules (36)

Nutrition and hormones are one part because they work on the same daily log. What she eats, how she feels and where she is in her cycle feed each other: food scoring uses her phase, insights use her meals and symptoms, and the reports combine both. It ships as three modules, one in each delivery. The ID shows the module: 1NH is Module 1 in Delivery 1, 2NH is Module 2 in Delivery 2, 3NH is Module 3 in Delivery 3. The condition and life stage modules (PCOS, postpartum and the rest) come after, and adjust all three parts.

Module 1. Daily log, Luna and first insights, Delivery 1 (15)

Goal: one daily log for symptoms, mood, energy, stress, sleep, water and meals, with Luna, the daily body advisor, and phase nudges on top. It finishes what is partly built (meal photo logging, insights, nudges, the daily message) together with the logs they need.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH1	**Symptom logging, basic (daily)**	Free	**Partly built**	Only the Day 15 and Day 30 progress form logs symptoms, so daily data is thin. Pain has no body area. Add a daily symptom picker with severity, stored against the cycle phase. Build detail. The picker lists common symptoms (cramps, headache, bloating, fatigue, nausea, breast tenderness, back pain, acne). Each gets a severity from 1 to 3, and pain also gets a body area. One entry per day, editable for 48 hours. Store the date and her cycle phase at the time of entry. Entries made offline sync later. Done when. She logs symptoms in under 30 seconds, entries show in her history with their phase, and other features can read them.	Nothing	She can log symptoms every day. Every hormone feature reads it: the pattern report, insights, rest day suggestions, the weekly plan and the doctor PDF.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH2	**Quick daily check in (mood, energy, stress, sleep)**	Free	**To build**	New row, because other logs and insights assume a quick check in exists. One short screen for mood, energy, stress and sleep, under half a minute, with an optional daily reminder (more reminders come in 1NH15). Build detail. One screen with four taps: mood, energy, stress and sleep, each on a 5 point scale. Optional daily reminder at a time she picks, off by default. A skipped day stays empty, never zero. 1NH3 to 1NH5 are fields on this screen, not separate screens. Done when. A full check in takes under 30 seconds, all four values save against the date and phase, and the reminder can be switched on and off.	Nothing	The fastest way to give the app the data it needs. It enriches insights, the pattern report, the doctor PDF and the weekly summary in this module and the next.
1NH3	**Energy logging**	Free	**To build**	Daily energy from low to high, stored against cycle phase. Can be built as part of the check in. Build detail. Five point scale shown as faces or a slider, saved as a number with date and phase. It shows on the home trend and is read by workout intensity (1M2) and rest day suggestion (2M4). Done when. Energy saves from the check in and the workout and insight rules can read it.	Quick daily check in (1NH2)	She records her energy each day. Workout intensity, rest day suggestions and insights use it.
1NH4	**Stress logging**	Free	**To build**	Stress level each day with an optional cause tag (work, family, health, money). Can be built as part of the check in. Build detail. Five point scale plus one optional cause tag: work, family, health, money or other. Two days in a row at 4 or 5 is flagged for the rest day rules (2M4). Done when. Stress and its cause save from the check in and the rest day rule can read them.	Quick daily check in (1NH2)	She records her stress each day. It also drives rest day suggestions.
1NH5	**Sleep logging**	Free	**To confirm**	The home screen already shows sleep. Check what exists and what is missing: hours slept and how rested she feels. Build detail. Hours slept in half hour steps and how rested she feels on 3 points. The home screen already shows sleep, so first list what it stores, then add the missing field. Keep one source of truth for sleep, not two. Done when. Sleep has one stored source, shows on home and in history, and feeds insights and workout rules.	Quick daily check in (1NH2)	She records how she slept. It may already be partly done.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH6	**Water intake logging**	Free	**To confirm**	The home screen already shows water. Check what exists and what is missing. Build detail. Cups or millilitres per day with a one tap add button and a daily goal she can change. The home screen already shows water, so check where the value is stored and reuse it. Reminder is optional. Done when. Water saves per day from one place, with a goal and a quick add, and shows in history.	Nothing	Daily water tracking. Low value on its own, and it may already exist.
1NH7	**Pakistani food database**	Free	**To build**	Our own list of common Pakistani and South Asian dishes (roti, daal, biryani, karahi, chai and so on) with calories, protein, carbs, fat and common portion sizes. Today calories come from a global recipe database, which handles local dishes poorly. Content more than code. Values reviewed by a dietitian. Build detail. Start with a first batch of the most common dishes, sized with the dietitian. Fields: dish name in English and Roman Urdu, aliases, serving sizes (katori, roti, plate), calories, protein, carbs, fat and fibre. Store as a searchable table the app and the AI both read. Version it so corrections reach the app without a release. Done when. Search finds a dish by its English or Roman Urdu name, portions work, and the dietitian has signed off the first batch.	A dietitian to prepare and check the list	Meal photo logging and food scoring give believable numbers for what she actually eats. It also feeds the free website calorie lookup later.
1NH8	**AI meal photo logging, capped (Free)**	Free	**Partly built**	Calories come from the typed name via Spoonacular, not from the photo. The cap is 3 per day, not monthly. Still needed: real photo recognition for calories and macros, a monthly cap with a visible counter, and an upgrade prompt at the limit (see 1P9). The food diary in the build list is not in the agency brief. Build detail. Flow: she takes or picks a photo, the AI proposes dishes and portions, she confirms, the entry saves. Match recognised dishes to the Pakistani food database (1NH7) first and the global database second. The counter shows used and left this month, and at the cap a screen offers Plus. Confirm how long photos are kept. Done when. A photo returns dish, portion, calories and macros, the monthly cap and counter work, and the upgrade screen shows at the limit.	Pakistani food database (1NH7); Tier counters and checks (X4)	She photographs a meal and gets calories and macros without typing. Daily use, it moves Free users to Plus at the cap, and food scoring and the AI nutritionist depend on it.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH9	**Edit and correct a logged meal**	Free	**To build**	After photo logging she can fix the dish, change the portion or add a missing item in two taps. Her corrections are saved so the same dish is recognised better next time. Build detail. The edit screen opens from any logged meal: change the dish from a search list, slide the portion, add or remove an item. Save each correction against the photo so recognition improves. Done when. Any logged meal can be corrected in two taps, the totals update, and the correction is stored.	AI meal photo logging (1NH8); Pakistani food database (1NH7)	Photo logging stays useful even when the AI guesses wrong, so she keeps using it.
1NH10	**Unlimited AI meal photo logging (Plus)**	Plus	**Partly built**	No photo AI and no plan based switch. Build after the free version, with no cap for Plus. Build detail. Same flow as 1NH8, but the cap check reads her plan. The cap number is a remote setting (2P5), not hard coded. Log the AI cost of every photo per user for the cost monitor (2P4). Done when. Plus users log with no cap, Free users keep the cap, and changing plan changes the limit straight away.	AI meal photo logging (1NH8)	Plus users log as many meals as they like, which is the main reason to move from Free to Plus.
1NH11	**Behavior based signal capture**	Plus	**Partly built**	Mixpanel and stored logs exist. Nothing feeds recommendations yet. Connect signals to suggestions. No user facing screen. Build detail. Record a small set of signals per user: which features she opens, what she logs, what she skips and what she taps on suggestions. Store them as plain events. Define the first two uses before building, for example which insight type she opens most and the best time for a push. No screen for her. Done when. Signals are stored per user, two named recommendations read them, and the events appear on the dashboard.	Nothing	Behind the scenes. It sharpens recommendations over time, but she does not see it.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH12	**Luna, your daily body advisor (personalized AI phase insights)**	Plus	**Partly built**	Luna already writes a daily insight with Gemini. Widen it into one daily Luna card that tells her: (1) where she is in her cycle today, (2) how she will probably feel, based on her phase and her own recent logs, (3) one food tip, (4) one movement tip that matches today's workout intensity (1M2), and (5) a short sleep and rest note. It reads her symptom, mood, energy, stress, sleep, water and meal logs. It runs as a batch ahead of time, not live, so the cost stays low. Food and movement tips come from approved rules, with wording reviewed once by a dietitian. Luna never gives medical advice, and a worrying pattern gets a gentle see a doctor line. Free users keep the short phase message (1NH14) and see what Luna adds. Build detail. A daily batch job builds one Luna card per Plus user from her last 7 to 14 days of logs and her phase, and saves it before she opens the app. The card has five parts: today's phase, how she will likely feel, a food tip, a movement tip and a sleep note. If there is not enough data yet, she sees the phase message and the first week messages (1P12). Tips follow the approved style and never give a diagnosis. Done when. Plus users see a fresh Luna card each morning built from their own data, with no live AI call when the app opens, and a new user sees a useful card on day one.	Daily symptom logging (1NH1); Quick daily check in to Sleep logging (1NH2 to 1NH5); Phase adaptive workout intensity (1M2); Dietitian review of tip wording	One place each morning that explains her body today and what to do about it, in plain words. It is the main reason to pay for Plus, and it gets sharper as she logs more.
1NH13	**Phase based nudge notifications**	Plus	**Partly built**	Re engagement pushes carry a phase line only. Add pushes timed to her own phase change, such as the day before her period. Build detail. Rules, not AI: a table of triggers (day before predicted period, first day of each phase, ovulation window) with message text per phase. Respect quiet hours and frequency caps from 1A6. Off switch in settings. Done when. Pushes fire on the right day for her predicted phase, honour quiet hours and can be turned off.	Cycle predictions (live)	She is nudged at the right time in her own cycle. Rules based, so no AI cost.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1NH14	**Daily phase message (Free)**	Free	**Partly built**	Works on the paid home as the Luna card, and Free users see a locked version. The brief wants a short generic message for Free, written once per phase with no AI call. Do not unlock Luna for Free, because Luna is the Plus insight. The locked Luna card is also an upgrade moment (1P9). Build detail. One message per phase, written once and stored, with several variants per phase so it does not repeat every day. Shown on the Free home in the slot where Plus users see Luna, with a small link to see what Plus adds. Done when. Free users see a different short phase message each day, no AI call is made, and Luna stays locked.	Nothing	Free users get a short daily message about their phase, which gives them a reason to open the app and shows what Plus adds.
1NH15	**Smart log reminders**	Free	**To build**	Gentle reminders to log a meal, water, symptoms and the daily check in. Times are learned from when she usually logs, with quiet hours she can set and a limit of 3 reminders a day. Each type can be switched off. Rules only, no AI call. The check in already has one optional reminder (1NH2), and this extends it to everything else. Done when. Reminders arrive at her usual times, respect her quiet hours and the limit of 3 a day, and each type can be switched off.	Quick daily check in (1NH2); Meal photo logging (1NH8); Water intake logging (1NH6)	She remembers to log without being nagged, so the data behind Luna and the reports stays complete. Cheap to build, and it protects every feature that reads her logs.

Order that works: logging first (1NH1 to 1NH6). The Pakistani food database (1NH7) before photo logging is finished (1NH8 to 1NH10). Then behavior capture (1NH11), then Luna, nudges and the daily message (1NH12 to 1NH14), which read the logs. Log reminders (1NH15) can run in parallel once the check in exists.

Module 2. Personal plan and reports, Delivery 2 (14)

Goal: she gets a food plan that fits her phase and her needs, sees her patterns each week and month, and can hand a summary to a doctor. It needs the logs from Module 1.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2NH1	**Food preferences and allergies filter**	Plus	**To build**	At setup she picks her diet type (vegetarian, halal only, dairy free and so on), allergies and foods she dislikes. Every plan, score and grocery list respects it, the same way the injury filter works for workouts. Rules only. Build detail. Setup and profile screen for diet type, allergies (nuts, dairy, gluten, eggs, seafood and so on) and dislikes, stored as tags. Every food suggestion is checked against the tags before it is shown. Allergies are hard blocks and dislikes are soft. Done when. A user with an allergy never sees a plan item, score or swap that contains it, tested on a set of sample profiles.	Pakistani food database (1NH7); Onboarding	Her plan never suggests food she cannot or will not eat. A basic need for personal nutrition.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2NH2	**Phase aware food scoring on meal photos**	Plus	**To build**	Shows how a logged meal fits her phase, with a one line reason. Build detail. After a meal is confirmed, a rule compares it with the phase guide (for example more iron after her period, steady carbs in the luteal phase) and shows a green, amber or neutral tag with a one line reason. The reason lines are written ahead per phase and food group, not generated live. Done when. Each logged meal shows a phase tag and a one line reason, and no AI call is made at that moment.	AI meal photo logging (1NH8)	She sees how each meal fits her phase, which turns logging into guidance. It cannot work until photo recognition exists.
2NH3	**Automatic weekly diet plan adjustment**	Plus	**To build**	The AI diet plan is live and generated on request, but it does not adjust by itself. It should update every week from meal, appetite, cravings, digestion and symptom logs. Timing still to be decided. Build detail. A weekly job, on a day she picks, reads her last 7 days of meals, appetite, cravings, digestion and symptoms and edits next week within safe limits, for example swapping foods and adjusting portions. She sees a short note on what changed and why. It never goes below a calorie floor set by the dietitian. Done when. Each week the plan updates by itself, shows a what changed note, and respects her allergies and the calorie floor.	AI meal photo logging (1NH8); Daily symptom logging (1NH1); Improved by Appetite and cravings logging (2NH5) and Digestion logging (2NH6)	Her plan updates every week from what she actually ate and felt. It is the biggest retention feature in nutrition.
2NH4	**AI grocery list with phase aware swaps**	Plus	**To build**	Shopping list grouped by category, built from her plan, with swaps suited to her phase. Build detail. One tap from the plan builds a list grouped by aisle with quantities for the week. Phase swaps appear as an alternative line, for example an iron rich option this week. Items can be ticked off, and the list rebuilds when the plan changes. Done when. The list matches the current plan, groups by category and updates when the plan is adjusted.	AI diet plan (live); Regenerate when Weekly plan adjustment (2NH3) ships	She gets a shopping list built from her plan, with swaps that suit her phase. It makes the plan usable in daily life.
2NH5	**Appetite and cravings logging**	Free	**To build**	Hunger level and cravings such as sweet, salty or carbs. Build detail. Two quick fields in the check in: hunger on a 5 point scale and craving chips (sweet, salty, carbs, none). Optional, one tap each, stored with date and phase. Done when. Hunger and cravings save in under 10 seconds and show in the weekly report.	Quick daily check in (1NH2)	She logs hunger and cravings, so food guidance reflects what her body does. It improves the weekly plan and PCOS guidance.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2NH6	**Digestion logging**	Free	**To build**	Normal, bloated, constipated or loose. Build detail. Four options: normal, bloated, constipated, loose, with an optional note. Shown in history and linked to phase in the weekly report. Done when. Digestion saves with one tap and appears in history and the report.	Quick daily check in (1NH2)	She logs how digestion felt, which explains bloating patterns in her report.
2NH7	**Medications and supplements logging**	Free	**To build**	Log medicines and supplements with optional reminders. Shows in the doctor report. Build detail. Add a medicine or supplement with name, dose as free text and times. Optional reminder push and a daily tick for taken. The app never advises on dose. It feeds the doctor PDF and the thyroid module. Done when. She can add, be reminded, tick off and review her medicines, and they print in the doctor PDF.	Nothing	She logs medicines and supplements with reminders. The doctor PDF, PCOS and Thyroid use it.
2NH8	**Period flow and spotting logging**	Free	**To build**	Flow heaviness, spotting and bleeding days. Build detail. Per period day, flow as spotting, light, medium or heavy, with optional clots and pain. Day entries join into one period record with length and heaviness, which update the start and end dates the cycle prediction already uses. Done when. Flow entries save per day, group into a period record, and show in the doctor PDF.	Nothing	She logs how heavy her flow is and any spotting. It improves cycle prediction and the doctor PDF.
2NH9	**Skin and hair logging**	Free	**To build**	Acne, oily or dry skin, hair fall, unwanted hair growth. Build detail. Chips for acne, oily skin, dry skin, hair fall and unwanted hair growth, each with a severity. Stored with date and phase. Photos are not part of this item. Done when. Skin and hair entries save in a few taps and show in history and the PCOS module later.	Nothing	She logs skin and hair changes, which helps spot hormonal patterns. PCOS uses it.
2NH10	**Weekly symptom pattern report**	Plus	**Partly built**	Progress hub compares symptoms and shows patterns, but sits behind a beta switch. Make it weekly, plain language and out of beta. It should link check in data (energy, stress, sleep, mood) to cycle phase. Build detail. A weekly job on a fixed day compares this week with the last 4 weeks and her phase, picks the top 2 or 3 patterns, and writes them in plain language from templates filled with her numbers. It needs at least 7 days of data, otherwise it says so. Move it out of the beta switch. Done when. Plus users get a plain language report each week once they have a week of data, and the beta switch is gone.	Daily symptom logging (1NH1); Progress hub out of beta; Uses Quick daily check in (1NH2) to Sleep logging (1NH5) (built in Nutrition and hormones Module 1)	Each week she learns why she feels the way she does, in plain language. It ships on symptoms and mood first, then adds energy, stress and sleep.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2NH11	**Weekly progress summary**	Plus	**Partly built**	Weekly check in and stats exist, but there is no plain language recap. Write the recap from her numbers, including mood, energy and sleep. Build detail. A template based recap from her numbers: days logged, workouts done, average mood, energy and sleep against last week, and one highlight. Rules only. Done when. A weekly recap shows her real numbers and compares them with last week.	Daily symptom logging (1NH1); Uses Quick daily check in (1NH2) to Sleep logging (1NH5) (built in Nutrition and hormones Module 1)	A plain language recap of her week from her own numbers. It shows her progress and supports renewals.
2NH12	**Doctor ready PDF export**	Plus	**Partly built**	PDF works in the beta hub. Add medications and cycle, symptom and check in history (mood, energy, stress, sleep), and unlock Share to doctor. Gating must be a setting we can change, because it can be Plus or a one time purchase. Done when. The PDF builds in under 10 seconds with every section above, and the Plus or paid gate can be changed from settings without an app release.	Daily symptom logging (1NH1); Needs Medications log (2NH7), Period flow logging (2NH8) and check in history (built in this module)	A clean summary she can hand to a doctor. Direct paid value, and it can be sold on its own.
2NH13	**Monthly nutrition and body report**	Plus	**To build**	A report each month in plain language, with simple charts. Nutrition: average calories, protein, carbs and fats, water, and how her meals fit each cycle phase. Body: sleep, energy, stress, mood and symptom trends, and how they changed from last month. It ends with three things to try next month. Built from her logs by rules, with an AI written summary on top, produced as a batch. She can download it as a PDF to share, and it can feed the doctor report (2NH12). Gating must be a setting, so it can be Plus only or part of Unlimited. Done when. A report builds for any user with a month of logs, every number matches her logs, and she can download it as a PDF.	Pakistani food database (1NH7); AI meal photo logging and meal edits (1NH8, 1NH9); Quick daily check in to Water intake logging (1NH2 to 1NH6); Weekly progress summary (2NH11)	A clear picture of her month and her progress, which is a strong reason to renew. It also shows her the value of logging, so she keeps doing it.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2NH14	**Period predictor: what to expect and when**	Plus	**To build**	Builds on the current period logger and the live date prediction. Using her own flow, spotting, length and symptom logs, it shows her next period as a date range instead of one day, and what to expect: how long it will last, whether flow is likely to be light, medium or heavy, and which symptoms usually come with it, with a reminder a few days before. It starts from average cycles and gets more accurate after about 3 logged cycles. A cycle that is often late or irregular gets a wider range, never a false certainty. If her pattern changes sharply, such as much heavier bleeding or a long gap, it gently suggests seeing a doctor. Rules and simple statistics, no AI call. Luna and the doctor PDF use it. Done when. On test profiles with 3 logged cycles the next period falls inside the range shown, flow and length estimates appear, and a sharp change shows the doctor prompt.	Period flow and spotting logging (2NH8); Daily symptom logging (1NH1); Cycle predictions (live); Doctor review of the see a doctor wording	She knows what her next period will be like and roughly when, so she is never caught off guard. It makes logging flow worth doing, and it feeds Luna, the plan and the doctor report.

Order that works: the preferences filter first (2NH1), then food scoring, plan adjustment, grocery list, cravings and digestion (2NH2 to 2NH6). The medications, flow and skin logs (2NH7 to 2NH9) next. The period predictor (2NH14) comes after flow logging (2NH8) and improves as her history grows. The reports and the doctor PDF last (2NH10 to 2NH13), because they use all the logs.

Module 3. Guidance and safety, Delivery 3 (7)

Goal: the AI nutritionist and Ramadan mode, plus the guidance features that rely on everything before them. The AI nutritionist is the only feature here that costs per user, so it comes once the logs, preferences and plan exist. Some rows are pipeline: estimates only until you confirm in writing.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3NH1	**AI nutritionist**	Unlimited	**To build**	A food chat that uses her plan, logs and phase. Medical questions get a safe reply that points to a professional. Build detail. A chat that receives her plan, her last 14 days of logs and her phase as context. Medical questions get a fixed safe reply. Cap on messages per day and per month, and log the cost of every message for the cost monitor (2P4). Food and nutrition topics only. Done when. Answers use her plan and logs, medical questions get the safe reply, and cost per user is visible.	AI meal photo logging (1NH8); Weekly plan adjustment (2NH3)	She can ask food questions any time and get answers from her own plan and logs. It is the reason to choose Unlimited, and it costs per message, so it comes late.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3NH2	**Ramadan mode**	Plus	**Pipeline**	Suhoor and iftar plans, gentler workouts, and a way to mark missed fasts against the cycle. Effort estimate only. Do not build until confirmed. Build detail. A switch in settings with start and end dates. The plan splits into suhoor and iftar, workouts move to gentler or after iftar, and she can mark a day as fasted or missed so the cycle view stays right. Pipeline: confirm before building. Done when. Ramadan mode switches on and off cleanly, plan and workouts follow it, and missed fasts are recorded.	Weekly plan adjustment (2NH3); Phase adaptive intensity (1M2)	A yearly reason to subscribe that global apps ignore. Direct user value.
3NH3	**Daily note**	Free	**To build**	A private free text note on any day, shown in history. Build detail. A text box on the day view, a few hundred characters, saved privately and editable. It shows in history and in the doctor PDF if she chooses. Done when. She can add and edit a private note on any day and see it in history.	Nothing	A private note on any day. Low effort, and it adds context to the doctor PDF.
3NH4	**Tone and style personalization**	Plus	**To build**	The same AI content reworded in her preferred voice, calm or high energy. It changes the wording, not the generation. Build detail. Two or three tone choices in settings. Each piece of content is stored once with a variant per tone, so choosing a tone swaps the text and costs nothing. Done when. Changing tone changes the wording of insights and messages with no extra AI cost.	Luna daily advisor (1NH12)	The same content in the voice she likes. Nice to have, and users cannot easily see it.
3NH5	**Cycle calendar with a plan ahead**	Plus	**Pipeline**	Shows the coming phases with what to eat and how to train, so she can plan her month. Effort estimate only. Do not build until confirmed. Build detail. A month view that colours the predicted phases and, on tap, shows a short food and workout line for that phase. Uses the existing phase rules. Predictions show as a range, not one exact day. Pipeline: confirm before building. Done when. The calendar shows the coming phases with a food and workout line for each.	Phase rules (live)	Lets her plan her month. High value and rules only.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3NH6	**Gentle red flag guidance**	Free	**Pipeline**	Rule based prompts that tell her when it is worth seeing a doctor. Wording must be reviewed by a doctor. Effort estimate only. Do not build until confirmed. Build detail. A list of rules, each with a trigger (for example very heavy bleeding for several days, or pain above a set level for two cycles), a gentle message and a see a doctor link. A doctor signs off every message. No diagnosis wording. Done when. Each rule fires only on its trigger, shows approved wording and links to booking or the doctor PDF.	Doctor ready PDF (2NH12); Doctor review of wording	Builds trust and safety.
3NH7	**Lab report upload**	Plus, or a one time purchase	**Pipeline**	She uploads results such as thyroid, vitamin D, iron and blood sugar and gets a plain language explanation with a trend. Wording must be reviewed by a doctor. Effort estimate only. Do not build until confirmed. Build detail. She uploads a photo or PDF of a report. The app reads a fixed list of values (TSH, vitamin D, iron, ferritin, HbA1c, fasting glucose), shows each against a normal range with a plain explanation and a trend over time. It never diagnoses. Pipeline: confirm before building. Done when. Values from a sample report read correctly, the explanation uses approved wording, and trends show across uploads.	Doctor review of wording	High perceived value, with some medical wording risk.

Order that works: the nutritionist and Ramadan mode (3NH1, 3NH2) need Module 2. The cycle calendar, red flag guidance and lab upload (3NH5 to 3NH7) need the logs. Daily note and tone (3NH3, 3NH4) can run in parallel.

Movement, in three modules (26)

Movement ships as three modules, one in each delivery. Each module works on its own and sets up the next. Module 1 is the guided workout core. Module 2 makes it personal and keeps her coming back. Module 3 is the recorded library. The ID shows the module: 1M is Module 1 in Delivery 1, 2M is Module 2 in Delivery 2, 3M is Module 3 in Delivery 3. Movement follows its own order, so Module 1 includes new work even though the rest of Delivery 1 is mostly partly built.

Module 1. Guided workout core, Delivery 1 (6)

Goal: she can follow a safe guided workout at home that fits her cycle phase, and her effort counts. Start with a small set of moves and add more later. The animated exercise clips (X8), the exercise list (X1), the workout player (X3) and video hosting (X5) have to exist first.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1M1	**Injury and limitation filter**	Plus	**Partly built**	Injuries are collected in onboarding and shown to the dietitian, but nothing filters moves or classes. Build the filter. It decides which animated moves and classes she can see. It must later carry postpartum cautions. Done when. Moves that conflict with her injuries never appear in guided workouts or class suggestions, tested on a set of sample profiles.	Exercise list with tags (X1); Live class tags (X2)	Moves that could hurt her are left out of her workouts. The animated workouts and the postpartum module are unsafe without it.
1M2	**Phase adaptive workout intensity**	Plus	**Partly built**	Classes are tagged by intensity with a Recommended badge. Add energy, stress and sleep inputs and a user override. Higher in follicular and ovulation, lower in luteal and menstrual. The same rule picks the intensity of the animated workouts. Done when. The same rule sets intensity for classes and guided workouts, uses her energy, stress and sleep, and she can override it.	Phase rules (live); Class intensity tags (exist); Uses Energy logging (1NH3), Stress logging (1NH4) and Sleep logging (1NH5) (built in Nutrition and hormones Module 1)	Her workouts get harder or easier with her cycle. This is the core Fit Her promise for movement, and guided workouts and the modules use the same rule.
1M3	**Animated guided workouts**	Plus	**To build**	An animated female trainer performs each move on screen while the workout plays with a timer and voice. Each move is animated once, checked by a trainer for correct form, and reused. The app builds each routine from the clips by rules, using her goal, time, phase and injuries, so no video is generated per user. No equipment moves come first. Done when. A first set of workouts plays end to end with the animated trainer, timer and voice, and each routine changes with her phase, time and injuries.	Animated exercise clips (X8); Exercise list with tags (X1); Workout player with mark done (X3); Injury and limitation filter (1M1); Phase adaptive intensity (1M2); Voice and written form cues (1M4)	She follows a guided workout at home that matches her goal, time and phase, with a trainer on screen. It reduces dependence on live classes and is the first goal of Movement.
1M4	**Voice and written form cues**	Plus	**To build**	A short voice and text cue for each move (breathing, what to watch for, the easier version), written once, stored and played during the workout. Hands free, so she does not need to look at the phone. At least a one line how to for every move ships with the workouts. Done when. Every move in the first workouts has a stored voice and text cue, and cues play during the workout and can be switched off.	Exercise list with tags (X1); Animated exercise clips (X8); Workout player with mark done (X3)	She knows how to do each move safely without watching the screen. It ships with the workouts, not after them.
1M5	**Post workout feedback**	Plus	**To build**	Two taps at the end of a guided workout: too easy, right or too hard. It feeds auto progression (2M3) and enhanced streaks (2M7). Rules only. Done when. The three option feedback shows at the end of every guided workout and its answer is stored for auto progression.	Animated guided workouts (1M3); Workout player with mark done (X3)	The next workout fits her better with no setup. The cheapest personalisation we can get.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1M6	**Basic streaks and milestone badges**	Free	**Partly built**	The attendance streak works. No badges exist yet. Build milestone badges. Build detail. Badges for example for 3, 7 and 30 day streaks, first workout and first log. Each has an icon, a name and a short message. An unlock shows a celebration screen once. Rest days must not break a streak (see 2M4). Done when. Badges unlock at the right points, show in her profile, and streaks survive rest days.	Nothing	She earns milestone badges for keeping a streak. A cheap habit builder, and sharing needs it.

Order that works: X1, X8, X3 and X5, together with the injury filter and intensity rule (1M1, 1M2). Then the guided workouts and cues together (1M3, 1M4), then the feedback taps and streaks (1M5, 1M6).

Module 2. Personal and consistent, Delivery 2 (12)

Goal: the workout adapts to her day and the app keeps her going. It uses the new logs built in Delivery 1 (check in, energy, stress, sleep and water). Everything here is rules, with no AI call per user.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2M1	**Time and energy picker**	Plus	**To build**	Before a workout she taps 10, 20 or 30 minutes and easier, normal or harder, and the routine rebuilds from the clips. It is her override of the phase rule (1M2). Rules only, no AI call. Done when. The picker changes the routine length and difficulty on the spot, and her choice overrides the phase rule for that day.	Animated guided workouts (1M3); Phase adaptive intensity (1M2)	She stays in control on a tired or busy day, so she skips less. No AI cost.
2M2	**Swap this exercise**	Plus	**To build**	One button on each move: too hard, it hurts, or I do not like it. The app swaps in a matching move from the exercise list and remembers the choice. A hurts answer also feeds the injury filter (1M1). Done when. Swapping returns a matching move within a second, remembers the choice, and a hurts answer updates the injury filter.	Animated guided workouts (1M3); Exercise list with tags (X1); Injury and limitation filter (1M1)	She never gets stuck on a move that does not work for her, and later workouts become more personal. Rules only.
2M3	**Auto progression**	Plus	**To build**	Reps, sets and duration rise weekly from her completed data and her two tap feedback (1M5). Simple arithmetic, no AI call. It only applies to guided workouts, because live classes have no sets and reps. Done when. Reps, sets or time rise on a weekly schedule from her completed work and feedback, with a cap so it never jumps too fast.	Animated guided workouts (1M3); Workout player with mark done (X3); Easier and harder versions in the exercise list (X1); Post workout feedback (1M5)	Her workouts get harder as she gets stronger, without a trainer.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2M4	**Rest day suggestion**	Plus	**To build**	Suggest rest or gentle movement on fatigue, cramps, low mood, low energy, high stress or poor sleep. Rules only, no AI call. Done when. On a day with the listed signals the app suggests rest or a gentle option, and following it keeps her streak.	Daily symptom logging (1NH1); Quick daily check in to Sleep logging (1NH2 to 1NH5); A rest day must not break her streak (Streaks and milestone badges (1M6))	The app tells her when to rest, instead of pushing her through a hard day. The gentle option uses Animated guided workouts (1M3).
2M5	**Missed session recovery workout**	Plus	**To build**	Today the missed session alert has no action. Add a short animated workout that matches the class she missed. Done when. Tapping the missed session alert opens a short matching workout that she can start at once.	Animated guided workouts (1M3); Missed session sheet with an action button and correct session data (X7); Live class tags (X2); Injury and limitation filter (1M1)	When she misses a class she gets a short alternative, so the alert leads somewhere.
2M6	**Today's plan card**	Plus	**To build**	One card on the home screen that picks the best option for today: a guided workout, a recorded class or a rest day. It uses her phase, energy, symptoms and time. Rules only. The recorded class option joins once the library exists. Done when. One card on home shows one option each day, chosen by the rules, and its choice changes with her phase and logs.	Phase adaptive intensity (1M2); Rest day suggestion (2M4); Animated guided workouts (1M3); Quick daily check in (1NH2); Recorded class library (3M1) for the recorded option	She does not have to decide what to do. One clear suggestion each day, and the link between the two goals of Movement.
2M7	**Enhanced streaks**	Plus	**To build**	Her thumbs feedback shapes what she gets next, and the app tells her why. Build detail. A short line after her feedback, for example because you liked strength, tomorrow has more. The streak counts any active day, a workout, a rest day or a check in, so a rest day keeps it alive. Founders to confirm the streak rule. Done when. The app explains its next suggestion in one line, and the streak rule works as agreed.	Streaks and milestone badges (1M6); Thumbs feedback (live)	The app tells her it has noticed what she likes and adjusts. It makes the app feel built for her.
2M8	**Fuel tips around workouts**	Plus	**To build**	Before and after tips on food and water from her phase and what she logged that day, for example a light snack an hour before and protein after. Shown on the workout screen. Rules only. Wording is reviewed by a dietitian. Done when. A tip shows before and after each guided workout, picked by phase and her logs, with wording approved by the dietitian.	Animated guided workouts (1M3); Food logging (exists); Water intake logging (1NH6); Phase rules (live)	Movement and nutrition work as one plan, and her workout tells her what to eat around it.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2M9	**Women specific basic sets**	Plus	**To build**	Short sets for core, pelvic floor and posture, built from the same animated clips. Content more than code. The pelvic floor and postpartum moves need review by a doctor or physiotherapist. Done when. The sets play like any guided workout, carry the right tags for the injury filter, and the pelvic floor moves are approved by a doctor or physiotherapist.	Exercise list with tags (X1); Animated exercise clips (X8); Animated guided workouts (1M3)	Moves that matter for women and that general apps skip. They support the postpartum and PCOS modules later.
2M10	**Progress photo timeline**	Plus	**Partly built**	Before and after photos are stored for admin only. Build a private timeline with side by side compare. Reuse the privacy notice. Done when. She can add photos privately, view them on a timeline and compare two side by side, and no one else can see them.	Progress hub out of beta; Private storage instead of admin only	A private timeline of her photos she can compare side by side. Strong retention at low cost, with no AI.
2M11	**Milestone sharing**	Active	**Partly built**	Normal posts work, but there are no badges to share. Build after badges. Build detail. A share button on a badge makes a post card with her badge and no private data. She can post to the community or save it as an image. Posts follow the same moderation as any other post. Done when. She can share a badge in two taps and no health data appears on the card.	Streaks and milestone badges (1M6)	She can share a badge with the community, which brings life to the feed.
2M12	**Cast to TV**	Plus	**To build**	Show a guided workout, a recorded class or a live class on the TV. Chromecast on Android and AirPlay on iPhone, with a larger layout for the timer and cues. For live classes show the trainer only, never other participants. Screen mirroring from the phone already works as a stopgap. Confirm with Hannan what runs the live classes and whether casting exists. Done when. A guided workout, a recorded class and a live class each cast to a TV from Android and iPhone, with the larger layout.	Workout player with mark done (X3); Animated guided workouts (1M3); What runs the live classes (ask Hannan)	She works out on the big screen at home, hands free. It makes guided workouts and live classes feel like a real class.

Order that works: the picker, swap and auto progression first (2M1 to 2M3). Then rest day, recovery workout and the Today's plan card (2M4 to 2M6). Then enhanced streaks, fuel tips, women specific sets, progress photos and sharing, then casting to the TV (2M7 to 2M12).

Module 3. Recorded library, Delivery 3 (8)

Goal: on demand classes filmed once, so she can train any time without a live trainer. It needs video hosting (X5) and class tags (X2). Filming can start while Modules 1 and 2 are being built, because it is content and not code. The last five rows are pipeline: estimates only until you confirm in writing.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3M1	**Recorded class library**	Active	**To build**	On demand classes filmed once, with filters. Build detail. A library screen with filters for length, level, focus, phase and equipment. A player that saves progress, marks done and checks her tier (X4). An admin tool to upload, tag and publish a class (X5). Done when. She can find, play and finish a class, progress saves, and an admin can publish a new class without help from the agency.	Video hosting and upload tools (X5); Live class tags (X2); Tier counters and checks (X4); Filmed content	On demand classes she can do any time. It is the biggest step away from depending on live classes.
3M2	**Trainer style filter**	Active	**To build**	Filter classes by trainer style: calm, high energy or strict. Build detail. Each trainer and class carries a style tag: calm, high energy or strict. Filter chips on the live schedule and in the library. No new content is needed. Done when. The filter narrows the schedule by style and every class has a tag.	Style tag on every trainer and class (X2); Does not need the recorded library	She can pick the trainer vibe she likes, on the live schedule from day one.
3M3	**Full recorded library (Unlimited)**	Unlimited	**To build**	Unlimited access to the whole recorded library. Build detail. A plan rule table says what Active and Unlimited can open. The check reads from the remote settings (2P5). The split between the two plans is still to decide. Done when. Unlimited opens the full library, Active opens its share, and the rule can change without an app release.	Recorded class library (3M1); A rule for what Active gets and what Unlimited gets (undecided)	Unlimited users get the whole library. Part of what Unlimited sells.
3M4	**Micro sessions**	Plus	**Pipeline**	Short 5 minute sessions such as cramp relief, stress breathing, gentle stretch and a low energy walk. Filmed once. Effort estimate only. Do not build until confirmed. Build detail. A library section of 5 minute clips tagged by need, such as cramps, stress and low energy. It appears as an option in the Today's plan card on low energy days. Pipeline: confirm before building. Done when. Each clip plays in the library and shows in the plan card on a low energy day.	Recorded class library (3M1)	Cheap content for low energy days, best after the recorded library.
3M5	**Live class replays in the library**	Active	**Pipeline**	Record live classes (the trainer only, never the users' cameras) and add them to the library after review, so the library grows without new filming. Needs trainer consent and storage. Effort estimate only. Do not build until confirmed. Build detail. After each live class a recording of the trainer only is saved, goes to a review step, then a tagged entry is added to the library. Needs trainer consent. Pipeline: confirm before building. Done when. A reviewed recording appears in the library with no user cameras or names in it.	Recorded class library (3M1); Video hosting and upload tools (X5); Trainer consent	The library fills from classes you already run. The biggest saving on content cost.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3M6	**Four week programs**	Active	**Pipeline**	Short programs built from existing classes and guided workouts, for example gentle strength for the luteal weeks. Effort estimate only. Do not build until confirmed. Build detail. A program is an ordered list of classes and workouts over four weeks with a progress screen. Admin can build one from existing items. Pipeline: confirm before building. Done when. She can start a program, see her week, and finish it with a completion screen.	Recorded class library (3M1); Animated guided workouts (1M3); Phase adaptive intensity (1M2)	A reason to come back four weeks in a row, which helps renewals.
3M7	**Low data and download mode**	Active	**Pipeline**	Lower video quality and offline download for the library and the guided workouts, for users on weak connections. Effort estimate only. Do not build until confirmed. Build detail. A quality choice (auto or low) and offline download of chosen classes, with a storage limit and automatic delete after a period. Pipeline: confirm before building. Done when. A downloaded class plays with no connection, and low quality plays smoothly on a weak connection.	Video hosting and upload tools (X5); Recorded class library (3M1)	The app works on slow connections in Pakistan, so more users can finish a class.
3M8	**Favourites and continue watching**	Active	**Pipeline**	Let her save classes and pick up where she left off. Effort estimate only. Do not build until confirmed. Build detail. A heart on each class, a Favourites list and a Continue watching row that stores the last position. Pipeline: confirm before building. Done when. Saved classes appear in one list and a half watched class resumes where she stopped.	Recorded class library (3M1)	Keeps her inside the library for little build effort.

Order that works: video hosting and class tags first, then the library (3M1), then the full library (3M3). The trainer style filter (3M2) does not need the library and can run in parallel.

Platform and growth, in three modules (28)

Platform runs in three modules, one in each delivery, like Movement. Module 1 makes the community safe, gives users help, and fixes the payment and first use flows. Module 2 keeps the community alive and lets you run the business. Module 3 is the pipeline: estimates only until you confirm in writing. The ID shows the module: 1P is Delivery 1, 2P is Delivery 2, 3P is Delivery 3.

Module 1. Safe community, help and smoother flows, Delivery 1 (15)

Goal: users can post safely, get answers any time, pay without getting stuck, and are guided to the right plan. The approved content library comes first for the community part, because the assistant and the later content poster read from it. The payment fix (1P5) starts on day one, in parallel.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1P1	**AI first pass community moderation**	All tiers	**Partly built**	Human only today. Every post waits for admin. Add an AI scan for posts and comments with a review queue. In the brief, posts publish first and only flagged ones are hidden, which changes today's flow, so confirm. Done when. New posts and comments are scanned, flagged ones are held in a queue for an admin, and the review flow works end to end.	Nothing	Behind the scenes. It protects the community without admin time. The report and block tools in 1P4 feed the same queue.
1P2	**Approved content library and review queue**	All tiers	**To build**	One library of approved plan details, FAQs, myth versus fact and short articles for nutrition, hormones and movement. An admin review queue where a doctor or dietitian approves each item before it can be used. The assistant, the content poster and the FAQ read only from approved items. Done when. An admin can add, review and approve items, and only approved items are returned to the assistant, poster and FAQ.	A named reviewer (doctor or dietitian)	Every bot and post says the same approved thing, and each answer is reviewed once. It has to exist before the assistant and the poster.
1P3	**AI sales and support assistant**	All tiers	**To build**	A small chat bubble that stays on screen. Sales mode explains plans, what each tier includes and how to upgrade, from approved content only. Support mode takes issues such as payment, a class link or login, logs a ticket, tries a standard fix, and hands off to a human or WhatsApp. It never gives medical or nutrition advice. It hides during live classes and workouts and on health logging screens, and each user has a daily message cap. Done when. The bubble answers plan questions from approved content, creates a ticket for an issue and hands off to a human, and never shows on the screens listed.	Approved content library (1P2); A ticket log in the admin area; Working payment path (1P5, agency item P-01)	She gets answers at any time, and you need less support staff. It helps sales without pressure.
1P4	**Report, block and anonymous posting**	All tiers	**To build**	Report and block on every post and comment, and an option to post without her name shown to other members. Admins can still see who posted. Reports go to the same review queue as AI moderation. Done when. Report, block and anonymous posting work on every post and comment, reports reach the same queue, and admins can still see the author.	AI first pass community moderation (1P1)	She feels safe enough to ask about sensitive topics, and anonymous posting brings out honest questions.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1P5	**Payment slip upload fix and clear payment states**	All paid	**Partly built**	The slip upload is broken: the camera does not open, and the error Please select an image first shows while the picker is still open, so users cannot pay manually. Fix the camera and gallery picker. Show an error only if the picker closes with no image, and show it inside the upload card, not as a floating message. Add a loading state on Submit and a success screen that says what happens next. Add a status line she can open any time: Sent, Under review, Active. Send a push when her plan turns active. Test it on a slow connection. Done when. A slip uploads from the camera and the gallery on a low end and a recent phone, the error shows only when no image is chosen, and the status line and the plan active push work on a test payment.	Nothing	She can pay without getting stuck and knows where her payment is. This is the working payment path (agency item P-01) that the assistant, the upgrade prompts and the photo cap wait for, so it goes first. Revenue path, critical.
1P6	**Faster plan activation (instant payment method)**	All paid	**To build**	Slips are verified within a few hours, so a paying user waits. Add at least one instant method, such as a wallet like JazzCash or Easypaisa, or a card, so the plan turns on right after payment. Keep slip upload as the backup. Until the instant method is live, the admin slip queue gets a target time and an alert for slips waiting too long. Which methods to add is your decision. A merchant account is needed and approval can take weeks, so apply now. Done when. At least one instant method turns the plan on within a minute on a test account, slip upload still works as the backup, and slow slips raise an admin alert.	Working payment path (1P5); A merchant account with the chosen provider	She is in the app within minutes of paying, so fewer people drop off at the last step and fewer write to support.
1P7	**Clearer plan page and paywall**	All paid	**Partly built**	The three plan cards look the same, two plans share one price with near identical features, and the Workout plan only card lists a customized diet plan. Differentiate the cards: a Most Popular tag on the recommended plan, a clear outcome line per plan, and a lighter look for the smaller plan. Show the savings on the 60, 90 and 180 day options. Show refund and cancellation terms before Subscribe. Add real proof: expert credentials and genuine testimonials only. Fix the copy errors. Done when. The plan page shows one clearly recommended plan, savings on longer plans and the refund terms with no copy errors, and plan views and taps show on the dashboard (1A1).	Refund and cancellation wording from you; Real testimonials or expert credentials (never invented)	She sees which plan fits her and why it is worth it before she pays. It lifts plan choice and the average revenue per user.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1P8	**Free trial and first week flow**	All paid	**To confirm**	The agency brief lists a free trial or low cost first week as Live, but the technical audit found no trial on any plan. Check on a test phone what a new user sees. Then make it clear: a visible offer on the plan page, a trial that starts with no extra steps, a day counter in the app, a reminder two days before it ends, and a one tap choice to continue at the savings price. Done when. A new user sees the trial offer, starts it in one step, sees the day counter and the reminder, and can continue at the savings price in one tap, with each step tracked.	Clearer plan page (1P7); Tier counters and checks (X4)	She tries Plus before paying, feels the value, and is asked to continue at the right moment. It lowers the barrier to the first payment.
1P9	**Upgrade moments (smart upsell prompts)**	Free	**To build**	One calm prompt at the moment she meets a limit or sees something locked, never random pop ups: when she hits the meal photo cap (1NH8), taps the locked Luna card (1NH14), opens a Plus class or workout, or nears the end of the trial. Each prompt says in one line what she gets and shows the savings price. Only one prompt per session, a dismissed prompt stays quiet for a week, and none appears on health logging or payment screens. Rules only, no AI call. Done when. Each prompt shows at its trigger once per session, a dismissed prompt stays quiet for a week, none shows on health or payment screens, and views, taps and conversions show on the dashboard.	Tier counters and checks (X4); Working payment path (1P5); Clearer plan page (1P7)	Free users learn what Plus adds exactly when it is useful, which moves them to paid without annoying them.
1P10	**Home screen with one daily focus**	All tiers	**Partly built**	Home shows about ten modules in one scroll, so there is no clear first action. Make one hero card (Luna, or today's class), move water, sleep, hormones, weight and calories into one swipeable stat strip, and keep two or three cards above the fold. Order the cards by her goal and cycle phase. Use one floating button, not two, placed above the bottom bar. Show one pop up at a time: finish the Day 7 review before the consultation prompt appears. Add a number box next to the weight slider. Done when. Home shows one hero card and two or three cards above the fold on a small phone, only one pop up shows at a time, and there is one floating button.	Luna daily card (1NH12)	She opens the app and knows what to do today, which raises daily use. The stacked pop ups and double buttons that cause mis taps go away.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1P11	**Fix wrong and broken screen details**	All tiers	**Partly built**	Small things that make the app look unreliable. The greeting that says Hi last (fall back to first name, then username, then Hi there). The counter that reads Day 13 of 7. Mixed date formats. The same trainer spelled three ways. Symptom numbers with no labels (add This month and Last month). The red Mark All Read button (use a neutral style). Notifications that all say just now. The unexplained ring on the Workout tab. The Meals coming soon label beside live meal logging. Pale small text that is hard to read. One logo spelling everywhere. Reword benefit chips that read as medical claims. Done when. Every item listed is fixed and checked on the screens named in the UI review, and no screen shows a placeholder or a wrong value.	Nothing	The app looks careful and trustworthy on the screens she sees every day. Cheap to fix, and it protects every other feature.
1P12	**Personal first week**	All tiers	**To build**	The app says personal patterns arrive after 14 days of check ins, and the Progress screen shows zeros for a new user. Give her value on day one: a first Luna message built from her setup answers and cycle date, a short first week checklist (log a check in, log a meal, try a guided workout), and first run screens that show one clear action instead of empty charts. Start from the goal she chose at setup, and show how her plan gets more personal as she logs. Done when. A new user sees a useful Luna card and a first week checklist on day one, and the Progress screen shows a clear first step instead of zeros.	Luna daily card (1NH12); Quick daily check in (1NH2); Onboarding quiz (live)	She feels the app knows her from the first day, so she stays through the weeks when it has the least data about her.
1P13	**Renewals, freeze and win back**	Paid tiers	**To build**	Freeze exists on Profile, but nothing brings her back. Add reminders before her plan ends (7, 3 and 1 days) with a one tap renew, a message sequence during a freeze, a resume button on Home, and a gentle phase based message after 7 days of no use. The missed session sheet also gets next steps, such as Join next and Find similar (X7). Rules only, and she can switch these messages off. Done when. Renewal reminders send at 7, 3 and 1 days, a frozen plan gets the message sequence and a resume button, and lapsed users get the 7 day message, with opens shown on the dashboard.	Tier counters and checks (X4); Working payment path (1P5); Missed session sheet (X7)	Fewer plans lapse by accident and more come back after a break. Retention with no AI cost.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
1P14	**Trust basics: privacy notice and hidden admin login**	All tiers	**To build**	Health data is collected, but the app shows no privacy message. Add a short plain notice at signup and in Profile: what is stored, who can see it, and who to contact to delete it. Move Login as Team or Admin off the public sign in screen. Removing the advertising SDKs is agency item S-06 and is not repeated here. Done when. The notice shows at signup and in Profile, and the admin login is no longer on the public sign in screen.	Nothing	She trusts the app with her health data, and the sign in screen looks like a consumer app, not a back office.
1P15	**Smaller, faster app**	All tiers	**To build**	The app is 570 MB, mostly duplicate native code, extra phone types, unused languages and unoptimised files. A big download loses users on weak connections and cheap phones. Ask the agency to publish in a smaller format, remove the unused parts, and give a target size with a before and after number. Check first whether the 14 day plan already covers this. If it does, keep this row as the acceptance check. Done when. A new build ships at the agreed smaller size with a before and after number, and the app still passes the 1A4 checks.	Nothing	More people finish the download, and the app opens faster on ordinary phones.

Order that works: AI moderation and the content library (1P1, 1P2), then the report and block tools (1P4), then the assistant (1P3), which needs the library and the working payment path (1P5). In parallel, start with the payment fix (1P5), then the plan page and trial (1P7, 1P8), instant payment (1P6) and upgrade moments (1P9). Then the home screen and screen fixes (1P10, 1P11), the personal first week (1P12), renewals (1P13), and trust basics and app size (1P14, 1P15).

If the agency says Delivery 1 is too big: move 1P6 (it waits on merchant approval anyway), 1P15 and 1P13 to Delivery 2 first, and run 1A7 last. Keep 1A1 to 1A3, 1P5, 1P7, 1P10, 1P11 and 1P12 in Delivery 1.

Module 2. Active community and running the business, Delivery 2 (6)

Goal: the community feels alive without a full time moderator, and you can control costs and plans from one place. The content poster and community manager both use the approved library from Module 1.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2P1	**AI content poster**	All tiers	**To build**	Drafts educational posts on nutrition, hormones and movement: a phase based tip, myth versus fact, a short weekly article, FAQs and seasonal topics such as Ramadan. A doctor or dietitian approves each draft in the review queue, then it posts on a schedule to the community feed and the home screen. Health content is never published without approval. She sees posts that fit her phase and interests, chosen by rules. Done when. Drafts appear in the review queue, nothing posts without approval, and approved items post on schedule to the feed and home screen.	Approved content library (1P2); AI first pass community moderation (1P1) for replies; Community feed (live)	A steady stream of trusted content that keeps the feed alive and builds trust, at low cost.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2P2	**AI community manager**	All tiers	**To build**	Welcomes new members, posts a weekly prompt tied to the cycle phase, answers common questions from approved content only, and nudges quiet threads. It never gives medical advice and hands health questions to a human. It is in the build list v2 but not in the agency brief, so confirm it. Done when. It welcomes new members, posts the weekly prompt, answers only from approved content and hands health questions to a human.	AI first pass community moderation (1P1); Approved content library (1P2); Community feed (live)	The community feels active without a full time moderator.
2P4	**AI cost monitor**	Behind the scenes	**To build**	Spend per AI feature and per user, with caps and an alert when a feature costs more than planned. Build detail. Log every AI call with feature, user, tokens and cost. Show daily and monthly totals per feature and per user. A cap per feature that slows or stops calls, and an alert by email or push when a cap is near or hit. Done when. Spend per feature and per user is correct against the provider bill, and an alert fires in a test.	Dashboard and event tracking (1A1)	Protects your low cost goal as the app scales.
2P5	**Remote controls**	Behind the scenes	**To build**	Turn features on or off and change what each plan includes without an app release. Hannan's notes already ask for gating to be a setting. Build detail. An admin screen of switches and values: feature on or off, which plan has each feature, photo caps, message caps. The app reads them at start and every few hours, with safe defaults if offline. Every change is logged with who and when. Done when. A change in the admin screen reaches the app without a release, and an offline app uses safe defaults.	Tier counters and checks (X4)	You can test plans and switch features safely, and the agency is not needed for every change.
2P6	**Referral program**	All tiers	**To build**	Invite code or link, with a reward applied after the friend's first payment. Build detail. Each user gets a code and a link. A friend who signs up with it and pays earns a reward for both, with the reward type still to decide (free days or points). Checks: one reward per friend and no self referral. The count shows in her profile and on the dashboard. Done when. A referred friend's first payment triggers the reward once, and referrals show on the dashboard.	Nothing	Brings in new users at a lower cost than paid ads. Growth, not a user feature.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
2P7	**Community streak visibility**	Free	**To build**	Shows how many members logged or trained today, as one total on the community screen. Counts only, no names and no rankings. The number appears only once it passes a small minimum that you set, so a quiet community never looks empty. Build detail. A daily count of members who completed a log or a workout, taken from the same events the streaks use. Shown as one line on the community feed, for example 128 members moved today. The minimum is a remote setting (2P5), and below it the line stays hidden. No member is named or ranked, and nothing links the count to a person. Done when. The total shows on the community screen and matches the day's logs and workouts on the dashboard, stays hidden below the minimum, and never shows a name or a rank.	Community feed (live); Basic streaks and milestone badges (1M6); Dashboard and event tracking (1A1); Remote controls (2P5) for the minimum	She sees she is not alone, which makes a young community feel alive and gives her a small push to log or train today. It costs almost nothing to build.

Order that works: the cost monitor first (2P4), which reads the tracking built in 1A1, then remote controls (2P5), then the content poster and community manager (2P1, 2P2), referral (2P6) when payments work, and community streak visibility (2P7) once the community has real activity. The founder dashboard (2P3) moved to Delivery 1 and is now part of 1A1.

Module 3. Growth and reach, Delivery 3 (7)

Goal: grow the user base and the revenue channels. All pipeline, so effort estimates only. Company and university plans are part of group plans (3P5). A free Plus trial is listed as live, and 1P8 checks it, so it is not repeated here.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3P1	**Privacy lock and discreet mode**	Free	**Pipeline**	PIN or fingerprint lock, neutral notification text, and the ability to export or delete her data. Effort estimate only. Do not build until confirmed. Build detail. A lock with PIN or fingerprint on opening the app and after time away. An option for neutral push text (app name and a generic line). Export her data as a file and delete her account with a confirmation. Pipeline: confirm before building. Done when. The lock works on both platforms, notifications show neutral text when switched on, and export and delete work.	Nothing	Builds trust for health data, and many women share phones. First in line.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3P2	**Urdu and Roman Urdu**	Free	**Pipeline**	The whole app, including insights and messages, in Urdu and Roman Urdu. Effort estimate only. Do not build until confirmed. Build detail. All screen text, push messages and content in Urdu and Roman Urdu with a language switch in settings. Urdu script needs right to left layout and a font that renders well. Approved content needs reviewed translations. Pipeline: confirm before building. Done when. The app can be used fully in each language, and right to left layouts look correct.	Nothing	Widens reach beyond English readers.
3P3	**Health Connect sync**	Plus	**Pipeline**	Pulls steps, sleep and heart rate from her phone or watch so she does not have to log them. Effort estimate only. Do not build until confirmed. Build detail. Ask permission for steps, sleep and heart rate from Health Connect on Android and Apple Health on iPhone. Imported values fill the same fields as manual entries and are marked as imported. Manual entry wins. Pipeline: confirm before building. Done when. Imported steps, sleep and heart rate appear after permission, and a manual edit is never overwritten.	Sleep logging (1NH5)	She logs less by hand.
3P4	**Gift a subscription and mother and daughter plan**	Paid tiers	**Pipeline**	She can buy a plan for someone else, or add a family member on a shared plan. Effort estimate only. Do not build until confirmed. Build detail. The buyer picks a plan and a recipient, pays, and the recipient gets a code by link or message to activate it. The family plan lets a second person join under one payment. Needs the tier counters. Pipeline: confirm before building. Done when. A gift can be bought, sent and redeemed once, and a family member can join and leave.	Tier counters and checks (X4)	More a sales feature than a user feature.
3P5	**Group plans for companies, workplaces and universities**	Separate	**Pipeline**	Bulk subscriptions sold to companies, workplaces and universities, with seat management and a simple admin for the organization. Effort estimate only. Do not build until confirmed. Build detail. An organization account with a seat count, invite by code or email domain, an admin screen showing seats used and removal of members, and invoice billing. Members see only their own data. The organization sees counts only, never health data. Pipeline: confirm before building. Done when. An organization can buy seats, invite people, remove them, and see counts only.	Dashboard and event tracking (1A1); Tier counters and checks (X4)	A sales channel that sells many seats at once. More a sales feature than a user feature.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3P6	**Points for streaks**	Plus	**Pipeline**	Streaks and milestones earn points she can spend on free days or a feature unlock. Effort estimate only. Do not build until confirmed. Build detail. Points are added for streak days and milestones, with a ledger she can see and a short list of rewards (free days, a feature unlock). A daily cap stops abuse. Pipeline: confirm before building. Done when. Points are added and spent correctly, with the ledger matching her activity.	Streaks and milestone badges (1M6); Tier counters and checks (X4)	Rewards the habit you want and reduces churn.
3P7	**Free website tools**	Free	**Pipeline**	Rules based tools on the website, each ending with continue in the app: a period and ovulation calculator, a which phase am I in quiz, a PCOS symptom checklist (not a diagnosis, ends with see a doctor), a Pakistani food calorie lookup, and a protein and water needs calculator. Later: a sample 7 day phase based meal plan and a Ramadan cycle and fasting planner. No BMI or weight loss calculators. Nothing she types is stored unless she signs up and agrees. Effort estimate only. Do not build until confirmed. Done when. Each tool runs in the browser without a login, uses approved wording, and every tool ends with a link into the app whose sign ups are tracked.	Approved content library (1P2); Pakistani food data; Doctor or dietitian review of all wording	Brings in search traffic at low cost and sends people to the app.

Delivery 3. Condition and life stage modules (8)

Goal: finish the condition modules once the logs and the movement features they depend on exist, so each ships whole. Each one adjusts all three parts: nutrition and hormones, movement and platform. PMS and PMDD, perimenopause and trying to conceive are pipeline: estimates only. Build nothing from the pipeline until you confirm it in writing.

Condition and life stage modules (8)

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3H1	**Condition modules framework (module engine)**	Plus	**Partly built**	The condition is only passed to the AI diet plan as text. Build modules as configuration, not code: selector in onboarding and profile (multi pick, cautious rule wins), plus tracking, insights, nutrition, workouts, notifications, doctor report and safety. Rules must be editable without an app release. All wording is reviewed by a doctor or dietitian before release. Done when. A condition can be switched on from configuration with its tracking, rules and wording and no app release, and a doctor has approved the wording.	Nothing	Behind the scenes, but every module needs it, so it comes first in this delivery.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3H2	**PCOS module**	Plus	**Partly built**	5 question screening with a risk result. PCOS is sent to the AI diet plan (low glycemic). Still needed: cycle range instead of one date, acne, hair and cravings symptoms, blood sugar food rules, strength plus moderate cardio led by her logs, fewer phase nudges, doctor report section, PCOS community space, safety prompts. Done when. Everything in the list ships, a doctor or dietitian has approved all wording, and a test profile gets PCOS specific plan, workouts and report.	Module engine (3H1); Uses Skin and hair logging (2NH9), Medications log (2NH7) and Appetite and cravings logging (2NH5), all built by now	Likely the largest audience for Fit Her, and the most complete module today, with screening and a diet link already in place. The skin and hair, medication and cravings logs exist by now.
3H3	**Postpartum module**	Plus	**Partly built**	Signup collects birth date and delivery type. Classes are locked until 6 weeks or 3 months plus doctor clearance. Screening exists. Still needed: feeding type, cycle prediction off until her period returns, recovery symptoms and mood check, weeks since delivery insights, recovery nutrition with no deficit, staged 5 to 15 minute workouts with stricter C section stages, gentle notifications, recovery doctor summary, postpartum circle, safety prompts. Done when. Staged recovery works with the stricter C section stages, cycle prediction stays off until her period returns, and a doctor has approved the wording.	Module engine (3H1); Injury and limitation filter (1M1); Staged workouts use Animated guided workouts (1M3) and Voice and written form cues (1M4), built by now	Recovery guidance in stages after birth. The injury filter and the staged workouts it needs are built by now, and part of it already exists in the signup and class lock.
3H4	**Thyroid module**	Plus	**Partly built**	Screening with a risk result. The condition goes to the diet plan as free text. Still needed: underactive or overactive choice, medication timing reminders, optional TSH, T3 and T4 values, thyroid symptoms, lab linked insights, iodine and selenium food rules, energy led workouts, lab trend doctor report, thyroid space. Never advise on dose. Done when. Medication reminders and lab linked insights work, the app never gives dose advice, and a doctor has approved the wording.	Module engine (3H1); Uses Medications log (2NH7), built by now	Tracking and guidance for thyroid conditions, with medication reminders that bring her back daily.
3H5	**Endometriosis module**	Plus	**Partly built**	Screening with a risk result only. Still needed: detailed pain log (location, 0 to 10, cycle timing, what helped), flare insights and high pain forecast, anti inflammatory food rules, low impact workouts that drop on high pain, pre flare heads up, pain diary for the doctor, support space, safety prompts. Done when. The pain diary, flare forecast and low impact workouts work together, with safety prompts approved by a doctor.	Module engine (3H1); Workout rules use Phase adaptive intensity (1M2), Animated guided workouts (1M3) and Rest day suggestion (2M4), all built by now	A pain diary and flare forecast, with food and workout guidance that fits endometriosis. The logs and workouts it needs exist by now, so it ships whole. Only screening exists today, so it comes last.

ID	Feature	Plan	Status	What exists today and what is left, or scope	Needs first	What she gets, and why this priority
3H8	**PMS and PMDD module**	Plus	**Pipeline**	Scope: a daily symptom rating in the days before her period for at least two cycles; steady blood sugar and magnesium rich foods; gentle movement; prompts to seek help for severe mood symptoms or thoughts of self harm. Effort estimate only. Do not build until confirmed. Build detail. The rating screen appears only in the days before her predicted period. After two cycles the app shows her PMS pattern. Severe mood symptoms or thoughts of self harm show a clear message to seek help, worded by a doctor. Pipeline: confirm before building. Done when. The rating screen, the pattern view and the help prompt work, and a doctor has approved the wording.	Module engine (3H1); Daily symptom logging (1NH1); Doctor review of safety wording	A new audience with a short, clear need.
3H9	**Perimenopause module**	Plus	**Pipeline**	Scope: changing cycle length, hot flushes, night sweats, sleep, mood and brain fog; calcium, vitamin D and protein guidance; strength and weight bearing work; doctor prompts for very heavy bleeding. Effort estimate only. Do not build until confirmed. Build detail. Symptom tracking for hot flushes, night sweats, sleep, mood and brain fog, with cycle length changes shown over time. Food and strength guidance from rules. Very heavy bleeding shows a see a doctor prompt. Pipeline: confirm before building. Done when. Tracking, pattern view and guidance work and the doctor prompt fires on its trigger.	Module engine (3H1)	A new audience once the module engine exists.
3H11	**Trying to conceive module**	Plus	**Pipeline**	Scope: fertile window, optional basal temperature, cervical mucus and ovulation test entries, an intercourse log; folate, iron and protein rich foods; moderate activity; doctor prompt after the usual time of trying. Effort estimate only. Do not build until confirmed. Build detail. A fertile window shown as a range, optional basal temperature, cervical mucus and ovulation test entries, and an intercourse log. Food and activity guidance from rules. A see a doctor prompt appears after the usual time of trying. Pipeline: confirm before building. Done when. The fertile window updates from her entries, the logs save privately, and the doctor prompt appears at the right time.	Module engine (3H1); Period flow logging (2NH8)	A new audience once the engine exists.

Already live

The 14 features the agency brief marks as Live. No build needed, but the brief expects a Developer directory entry for each.

Live feature	Plan	Segment	Note
Cycle and period tracking with prediction	Free	Hormones	Predicts the date only. What to expect (flow, length) comes with 2NH14.
Mood logging	Free	Hormones	
General hormonal wellbeing logic layer	Plus	Hormones	The base every condition module builds on.
AI diet plan	Plus	Nutrition	Generated on request. It does not adjust automatically yet (2NH3).
Unlimited live sessions across 9 daily slots	Unlimited	Movement	
Generic missed session reminder	Free	Movement	The alert has no action yet (X7 and 2M5).
Basic progress tracking	Free	Movement	The brief says Live. The build list says partly built, because the Progress hub is behind a beta switch.
Onboarding preference quiz	Free	Platform and growth	
Thumbs up or down feedback after sessions	Free	Movement	
Community access and feed	Free	Platform and growth	
Ad free experience	Plus	Platform and growth	
Free trial or low cost first week	All paid	Platform and growth	The brief says Live, but the technical audit found no trial. 1P8 checks it.
Savings pricing on 3 and 6 month plans	All paid	Platform and growth	
International USD pricing	All paid	Platform and growth
