FitHer agency brief

Tiers, pricing and features across hormones, nutrition and movement, plus what we need from the agency.

FitHer is a women's wellness app built around hormones, nutrition and movement. Every recommendation in the app reflects where the user is in her cycle. Live classes stay, but as one part of the product and not all of it. Most of what we build should be software and AI that scales at low cost. Revenue comes from subscriptions and, on the free tier, ads.

Part 1. App review and developer directory

Hannan will submit the current APK. Please review it in full and complete or fix whatever is missing or broken across three areas: technical, UI and UX, and development. Before you start fixing, send a written findings list with each item rated by severity (blocks revenue, hurts trust, polish) and an effort estimate. Fix in that order, with anything that blocks payments or revenue first.

Developer directory. Every feature table in Part 3 has a last column called Developer directory. After reviewing the APK, fill it in for every feature: what exists in the app today, what works, what is missing or broken, and anything we should know before building. Return the filled document with your findings list. No feature should be left blank.

Part 2. Tiers and pricing

Tier	How it is described to users
Free	Know your body. Free forever.
Plus	Stop guessing what your body needs.
Active	Now with real classes, live.
Unlimited	Everything, without limits.

Price points: Free, PKR 1,500, PKR 2,500, PKR 3,500 and PKR 4,000.

- Each tier includes everything in the tier below it.
- Condition modules (PCOS, postpartum, thyroid, endometriosis and the ones in the pipeline) are part of Plus and every tier above it. They are described in full in 3.7.
- Current subscribers on the workout and diet bundle keep their existing price and their equivalent tier. New features are added to their plan at no extra charge. There is no forced migration.
- The paywall shows four short cards, with Plus marked Most popular. Tapping a tier expands it into three groups, understand your body, eat right for your cycle and move right for your cycle, so users never see a long feature list.

Part 3. Features by tier

Status is taken from Hannan's tracker. **Live** means users can fully use it today. **Partly built** means work has started and needs finishing. **To build** means it is new and in the current scope. **To confirm** means something may already exist in the app and the agency should check and report what is there. **Pipeline** means it is planned for later and is not in the current build. For Pipeline items, send an effort estimate so we can plan, but do not build until we confirm. The last column is for the agency to fill in.

Logging principle. All logging stays free, because the more she logs the more useful the app becomes and the more likely she is to stay. What she pays for in Plus is what the app does with the logs: insights, patterns, plans and suggestions. Every log below feeds those features.

3.1 Free

Area	Feature	Status	What it does	Developer directory: current standing
Hormones	Cycle and period tracking with	Live	Log periods, predict the next cycle and the	100%

Area	Feature	Status	What it does	Developer directory: current standing
	prediction		current phase.	
Hormones	Period flow and spotting logging	To build	Log how heavy the flow is, spotting and days of bleeding. Improves cycle prediction and the doctor report.	
Hormones	Symptom logging, basic	Partly built	Log daily symptoms, including pain, with severity. Each entry is stored against the cycle phase.	Partly there. DailyCheckin stores cramp and bloating severity with cycle day and phase, and the Progress hub turns them into a symptom snapshot. But the only screen that logs them is the Day 15 and Day 30 progress form, so daily symptom data is thin. Pain has no body area. Needs a daily symptom picker, ideally inside the quick check in.
Hormones	Skin and hair logging	To build	Log acne, oily or dry skin, hair fall or unwanted hair growth. Useful for spotting hormonal patterns.	
Hormones	Daily phase message	Partly built	One short generic message a day about the current phase. Written once per phase, no AI call per user.	Works. Written templates per phase and cycle day (StaticInsights on the server) show on the paid home as the Luna card, with no AI call. The free (unpaid) home shows a locked version of this card, so free users do not see the message yet. Decide whether free users should see it.
Across	Mood logging	Live	Daily mood entry.	100%
Across	Quick daily check-in	Live	One short screen that covers mood, energy, stress and sleep in a few taps, in under	100%

Area	Feature	Status	What it does	Developer directory: current standing
			half a minute, with an optional daily reminder. It is the fastest way for her to give the app the data it needs.	
Across	Energy logging	To build	Energy level from low to high each day, stored against the cycle phase.	
Across	Stress logging	Live	Stress level each day with an optional cause tag such as work, family, health or money.	100%
Across	Sleep logging	Live	Hours slept and how rested she feels. The home screen already shows sleep, so check what exists and what is missing.	100%
Across	Water intake logging	Live	Daily water tracking. The home screen already shows water, so check what exists and what is missing.	100%
Nutrition	Appetite and cravings logging	To build	Log hunger level and cravings, for example sweet, salty or carbs, so food guidance can respond to real patterns.	
Nutrition	Digestion logging	To build	Log how digestion felt that day, for example normal, bloated, constipated or loose.	
Nutrition	AI meal photo logging, capped	Partly built	Photo to calories and macros. Limited number per month, with a counter and an upgrade prompt at the limit.	Not AI yet. The Track Calories screen takes a photo plus a typed food name, but the calories and macros come from the typed name through the Spoonacular API, not from the photo. There is a cap of 3 checks per day with a counter that resets daily. Missing: real photo recognition, a monthly cap and an upgrade prompt at

Area	Feature	Status	What it does	Developer directory: current standing
				the limit. Meals are also not saved to a food diary.
Across	Medications and supplements logging	To build	Log medicines and supplements she takes, with optional reminders, so they show in the doctor report and are not confused with symptom patterns.	
Across	Daily note	To build	A private free text note on any day, shown in her history.	
Movement	Generic missed session reminder	Live	Reminder when a planned session is missed.	100%
Across	Basic progress tracking	Partly built	Weight and simple stats with a trend.	Works in parts. Weight, waist and hip weekly check ins (WeeklyCheckin), weight trend and goal projection, classes attended and streak. The new Progress hub with charts is behind a beta switch, so most users still see the older progress screen. Needs the beta switch removed after testing.
Across	Basic streaks and milestone badges	Partly built	Streak counter and badges at set milestones.	Streak works, badges do not. A day streak based on class attendance shows on the home and profile. There are no badges; the free progress screen only shows weight milestones.
Across	Community streak visibility	To build	Shows how many members logged or trained today as a simple total, so she can see the community is active. No rankings and no leaderboard.	

Area	Feature	Status	What it does	Developer directory: current standing
Across	Onboarding preference quiz	Live	Captures goal, intensity, equipment, time and style at signup.	100%
Across	Thumbs up or down feedback after sessions	Live	One tap feedback after a session, used to shape later suggestions.	100%
Across	Community access and feed	Live	Community feed for all users.	100%
Across	In app ads	To build	Ads for free users only, never on payment screens or on health input screens.	

3.2 Plus (everything in Free, ad free, plus)

Area	Feature	Status	What it does	Developer directory: current standing
Across	Ad free experience	Live	No ads for paid users.	100%
Hormones	Personalized AI phase insights	Partly built	A daily insight based on her own mood, energy, stress, sleep, symptom and activity logs. Replaces the generic message. Generated in a batch ahead of time, not live.	Luna by FitHer uses the Gemini AI API to write the daily phase insight on the home screen.
Hormones	Phase based nudge notifications	Partly built	Notifications timed to her own cycle, for example before a phase shift.	Partly there. Re engagement pushes add a short phase line (for example a lighter training line in luteal). There is no push timed to her own phase change, such as the day before her period.
Hormones	Symptom pattern analyzer with weekly report	Partly built	Weekly report linking her symptoms and check ins (energy, stress, sleep, mood) to cycle phase in plain language.	Partly there. The Progress hub compares symptom levels with the previous period (SymptomDelta) and shows top patterns and a phase chart. Not weekly, not in plain language, and

Area	Feature	Status	What it does	Developer directory: current standing
				limited by how little symptom data is logged. Hidden behind the Progress beta switch.
Hormones	Doctor ready PDF export	Partly built	Cycle, symptom and check in history (mood, energy, stress, sleep) plus medications, as a PDF she can hand to a doctor.	Works in the Progress hub (beta). Download PDF includes cycle context, weight, water, classes, sleep and energy averages, a symptom snapshot and notes for a clinician. Missing: medications, stress, mood history and a direct Share to doctor, which shows as locked.
Hormones	General hormonal wellbeing logic layer	Live	Condition agnostic phase logic that drives insights, food and workout guidance.	100%
Hormones	Condition modules	Partly built	She selects a condition and the app adjusts its tracking, insights, nutrition, workouts, notifications and doctor report on top of the same tracked data. It is a layer, not a separate product. Each module is described in 3.7.	Partly there, as screening only. See 3.7 for each module.
Hormones	Behavior based signal capture	Partly built	Records what she logs, skips and completes so recommendations sharpen over time. No user facing screen.	Partly there. Mixpanel tracks screens and key events (class views, sign up steps, plan actions). Meal logs, water, mood and attendance are stored. Nothing feeds recommendations yet.
Nutrition	Unlimited AI meal photo logging	Partly built	Same as the free version with no monthly cap.	Not built. Same as the free item: no photo AI, and the only

Area	Feature	Status	What it does	Developer directory: current standing
				cap is 3 per day for everyone. There is no plan based switch.
Nutrition	AI diet plan	Live	Personalized plan from her profile and goals. Generated on request. It does not adjust automatically yet.	100%
Nutrition	Automatic weekly adjustment of the diet plan	To build	Plan updates itself each week from her meal, appetite, cravings, digestion and symptom logs. Timing still to be decided.	
Nutrition	Phase aware food scoring on meal photos	To build	Shows how well a logged meal fits her current phase, with a one line reason.	
Nutrition	AI grocery list with phase aware swaps	To build	Shopping list built from her plan, with swaps suited to her phase.	
Movement	AI generated no equipment workouts	To build	Home workouts matched to her goal, time available and phase. Generated ahead for groups of similar users and reused.	
Movement	Phase adaptive workout intensity	Partly built	Suggests higher intensity in follicular and ovulation, lower in luteal and menstrual, and adjusts for the energy, stress and sleep she logged. She can override it.	Partly there. Each class type is mapped to high, medium or low intensity and classes that fit her phase get a Recommended badge. It does not use her energy, stress or sleep logs, and there is no override setting.
Movement	Rest day suggestion	To build	Suggests rest or gentle movement when her logs show fatigue, cramps, low mood, low energy, high stress or poor sleep.	
Movement	Missed session	To build	Short alternative	

Area	Feature	Status	What it does	Developer directory: current standing
	recovery workout		workout when she misses a session, so the notification always leads to an action.	
Movement	Injury and limitation filter	Partly built	She flags a limitation once and unsuitable moves are left out of her workouts.	Partly there. Injuries are asked in the trial onboarding and pre consultation form and shown to the dietitian. Nothing filters moves or classes.
Movement	Written form cues per exercise	To build	Short checklist of what to watch for, shown next to each move. Written once and stored.	
Movement	Auto progression	To build	Reps, sets and duration increase week to week based on what she completed. Simple arithmetic on logged data, no AI call.	
Movement	Progress photo timeline	Partly built	Private photos she can compare side by side across dates.	Partly there. A ProgressImage table stores before and after photos, viewed by admin. There is no private timeline or side by side compare for her. Progress submissions deliberately do not take photos, and there is a photo privacy notice to reuse.
Across	Weekly progress summary	Partly built	Plain language recap of her week, including mood, energy and sleep, written from her real numbers.	Partly there. Weekly weight check in and a weekly rating exist, and the Progress hub shows week, month and year stats. No plain language recap is written.
Across	Enhanced streaks	To build	Builds on basic streaks. Her thumbs up or down feedback shapes what she is	

Area	Feature	Status	What it does	Developer directory: current standing
			offered next, and the app tells her so, for example you have been liking lower intensity sessions this week.	
Across	Tone and style personalization	To build	The same AI content is delivered in the voice that works for her, for example calm or high energy, based on what she has responded well to. It changes the wording, not the generation, so it adds almost no cost.	

3.3 Active (everything in Plus, plus)

Area	Feature	Status	What it does	Developer directory: current standing
Movement	Limited monthly live sessions	Partly built	A set number of live sessions each month with female trainers, with a visible count of what is left and an upgrade prompt at the limit.	Not built as a limit. Live classes work (daily schedule, trainer link, join button, attendance and missed session tracking), but access is on or off by plan. There is no monthly count, no sessions left counter and no upgrade prompt.
Movement	Recorded class library	To build	On demand classes filmed once and served to any number of users, with filters.	
Movement	Trainer style filter	To build	Filter classes by trainer style, for example calm, high energy or strict.	
Across	Milestone sharing	Partly built	She can share a badge to the community feed.	Not built. She can create a normal post, but there are no badges to share.

Active adds nothing new in hormones or nutrition. It adds live classes and the recorded library.

3.4 Unlimited (everything in Active, plus)

Area	Feature	Status	What it does	Developer directory: current standing
Movement	Unlimited live sessions	Live	Live classes across all 9 daily slots with female trainers, join at any time.	100%
Movement	Full recorded library	To build	Unlimited access to the whole recorded class library.	
Nutrition	AI nutritionist	To build	A chat where she asks food questions and gets plan adjustments, using her plan, logs and phase. Medical questions get a safe reply that points to a professional.	

3.5 Across all tiers, and platform wide

Area	Feature	Status	What it does	Developer directory: current standing
Across	AI first pass community moderation	Partly built	AI scans every post and comment. Flagged content is hidden and sent to a human review queue.	Human only. Every post is held until an admin approves it. There is no AI scan and comments are not checked.
Across	Referral program	To build	Each user gets a code or link to invite friends. A reward is applied after the friend's first payment.	
Across	Website display ads	To build	Ads on the blog and calculators on the website.	
Across	Free trial or low cost first week	Live	Intro offer on paid tiers.	100%
Across	Savings pricing on 3 and 6 month plans	Live	Discounted longer durations.	100%
Across	International USD pricing	Live	Separate pricing for users outside Pakistan.	100%

3.6 Add on, sold per session outside the tiers

Area	Feature	Status	What it does	Developer directory: current standing
Movement	Human trainer 1:1 booking	Partly built	She books a personal session with a trainer and pays per session. Available on any tier. Capacity is limited by	Not built for trainers. The 1:1 booking flow built for dietitians (free slots, booking,

Area	Feature	Status	What it does	Developer directory: current standing
			the slots we release.	reschedule before confirmation, video link, no show handling) can be reused. Pay per session is not built.

3.7 Condition modules, by plan

Modules are a layer on the same tracked data. They are included in Plus and every tier above it. Each new module reuses the same structure, so later ones are light to add.

Module	Plan	Status	Developer directory: current standing
General hormonal wellbeing	Plus	Live	100%
PCOS	Plus	Partly built	Screening built, module not built. A 5 question PCOS screening with a risk result exists, and PCOS is passed to the AI diet plan (low glycemic foods). No extra tracking, wider cycle window, workout rules, notifications or doctor report section yet.
Postpartum	Plus	Partly built	Access rules built, module not built. At signup she picks postpartum and gives the birth date and delivery type. The app locks classes until the safe waiting time (6 weeks normal, 3 months C section, set in server settings) and she confirms her doctor has cleared her. A postpartum screening exists. No postpartum tracking, food or workout rules after that.
Thyroid	Plus	Partly built	Screening only. A thyroid screening with a risk result exists and conditions go to the AI diet plan as free text. No module rules yet.
Endometriosis	Plus	Partly built	Screening only. An endometriosis screening with a risk result exists. No pain tracking, food or workout rules yet.

Module	Plan	Status	Developer directory: current standing
Perimenopause	Plus	Pipeline	
PMS and PMDD	Plus	Pipeline	
Trying to conceive	Plus	Pipeline	

3.7.1 How a module works

A module is a set of rules and content, kept as configuration and not hard wired into the app, so a new module can be added without new code. Every module controls the same eight things.

Component	What it controls
Selector	At onboarding and in her profile she picks the conditions that apply, one or several, including ones she only suspects. She can change it any time. If she picks more than one, the more cautious rule wins, for example the lower intensity limit.
Tracking	Extra symptoms and fields added to her log, and the cycle prediction settings, for example a wider window for irregular cycles.
Insights	The condition context added to the daily insight, the pattern report and the weekly summary.
Nutrition	A rules table used by the diet plan, food scoring, grocery list and swaps: foods to favor, foods to limit, meal timing and a calorie floor.
Workouts	A rules table used by generated workouts, intensity suggestions and rest days: allowed movement types, intensity limit, progression pace and which recorded classes and micro sessions are suggested.
Notifications	Reminders and nudges specific to the condition, inside the existing limits and quiet hours.
Doctor report	Extra sections added to the doctor ready PDF.
Safety and wording	Red flag prompts that tell her when to see a doctor. The app never diagnoses and never advises changing or stopping medication. All wording, food rules and workout rules are reviewed by a qualified doctor or dietitian before release.

3.7.2 PCOS

Area	How it is managed
Tracking	Cycle prediction shows a range instead of one date, because cycles can be irregular. Adds acne, excess hair growth, hair thinning and cravings to the symptom list. Optional weight and waist entries. Uses the skin and hair log and the medications and supplements log.
Insights	Tracks how much her cycle length varies over time and links energy, cravings, sleep, stress and symptoms. Explains patterns in plain language and never diagnoses.
Nutrition	The diet plan is built around steady blood sugar: protein and fibre with every meal, whole grains and daal over

Area	How it is managed
	refined carbs, fewer sugary drinks and regular meal timing. Food scoring rewards blood sugar stability and low inflammation. Grocery swaps lean toward whole wheat, daal, vegetables, yogurt and nuts. The cravings log adjusts the plan.
Workouts	A mix of strength training and moderate cardio, with gentle days built in. Because cycles are irregular, intensity follows her logged energy, stress and sleep more than the predicted phase. Rest day suggestions appear on high stress or poor sleep days.
Notifications	Fewer phase timed nudges, since dates are less predictable. More prompts to log her period start and a weekly check-in.
Doctor report	Cycle length history, symptoms, weight trend and medications in one view.
Community	A PCOS space in the community, moderated like the rest.
Safety	Prompts to see a doctor when periods are missed for several months or symptoms get worse. No medication or dose advice.

3.7.3 Postpartum

Area	How it is managed
Tracking	At setup she enters her delivery date, delivery type (vaginal or C section) and feeding (breastfeeding, mixed or not). Cycle prediction stays off until her period returns. Adds bleeding, pain, back pain, pelvic floor issues, hair fall and night sleep disruption to the log. Includes a gentle mood check.
Insights	Framed by weeks since delivery and not by cycle phase. Shows sleep, energy and mood trends and reminds her that recovery is gradual.
Nutrition	No calorie deficit and no weight loss goals in the early weeks. The plan supports recovery and breastfeeding with extra protein, iron, calcium and fluids, in small frequent meals. Food scoring and swaps favor iron rich and hydrating foods. Weight goals unlock later, and only if she asks.
Workouts	Staged by recovery. Starts with walking, breathing and pelvic floor work, then light strength. Higher intensity unlocks only after she confirms her doctor has cleared her. C section recovery uses stricter stages. The injury and limitation filter is preloaded with postpartum cautions. Sessions are short, 5 to 15 minutes, to fit around the baby.
Notifications	Gentle tone with no guilt about missed sessions. Quiet hours respect night feeds. Reminders for postnatal checkups that she sets.
Doctor report	A recovery summary for her follow up visit covering bleeding, pain, mood, sleep and feeding.
Community	A postpartum circle, moderated.

Area	How it is managed
Safety	Prompts to contact a doctor for heavy bleeding, fever, severe pain, or low mood that lasts. The mood check shows clear help information. Rules reviewed by a doctor.

3.7.4 Thyroid

Area	How it is managed
Tracking	She selects underactive, overactive or not sure. Adds medication tracking with timing reminders, optional lab values (TSH, T3, T4) with dates, and symptoms: fatigue, weight change, hair fall, feeling cold or hot, constipation, palpitations and brain fog.
Insights	Links energy, weight, cycle length and symptoms to lab dates and to whether medication was taken on time. Shows trends she can discuss with her doctor.
Nutrition	Whole food focus with iodine and selenium rich foods and steady protein and fibre. Never recommends supplements. Reminds her to keep medication apart from calcium and iron rich foods or supplements, as her doctor advises. No extreme calorie cuts.
Workouts	Follows her logged energy. Gentle on low energy days, steady strength and walking otherwise. If palpitations are logged, it suggests rest and checking with her doctor. Higher intensity only when she feels well.
Notifications	A daily medication reminder and lab test reminders at intervals she sets.
Doctor report	Lab trend, symptoms and medication timing in one view.
Community	A thyroid space in the community, moderated.
Safety	Never suggests changing a dose or stopping medication. Prompts to see a doctor for palpitations, sharp changes in symptoms or a run of missed medication.

3.7.5 Endometriosis

Area	How it is managed
Tracking	A detailed pain log: location (pelvic, lower back, legs, bowel, bladder), intensity from 0 to 10, timing against her cycle, and what helped, such as heat, medicine or rest. Optional entries for pain during intercourse, bowel and bladder symptoms, heavy bleeding, bloating and fatigue.
Insights	Finds when pain is highest across the cycle and links flares to sleep, stress, food and activity. Shows likely high pain days ahead so she can plan.
Nutrition	Anti inflammatory focus: vegetables, fruit, whole grains, fibre and omega 3 rich foods, with less refined sugar and processed food. Food and flare tracking helps her spot her own triggers, and the app does not push elimination diets. Lighter, easier meals are suggested on flare days.
Workouts	Low impact by default: walking, yoga, stretching, mobility and pelvic floor relaxation. Intensity drops automatically when she logs high pain, and rest day suggestions

Area	How it is managed
	appear on flare days. Progression is slower.
Notifications	A heads up before her expected high pain window, gentle self care reminders, and medication reminders if she uses them.
Doctor report	A pain diary by cycle phase with location and intensity. This matters because diagnosis is often delayed and doctors want evidence.
Community	A supportive space, moderated.
Safety	Prompts to see a doctor for severe or worsening pain or sudden new symptoms. No medication advice.

3.7.6 Pipeline modules

The same eight components apply. These are the main differences.

Module	Tracking	Nutrition	Workouts	Safety
Perimenopause	Changing cycle length, hot flushes, night sweats, sleep, mood and brain fog.	Calcium, vitamin D, protein and steady blood sugar, with foods such as flax and soy as general support.	Strength and weight bearing work for bone health, with intensity that respects poor sleep.	Doctor prompts for very heavy bleeding or bleeding after a long gap.
PMS and PMDD	A daily symptom rating through the days before her period for at least two cycles, which doctors ask for.	Steady blood sugar, magnesium rich foods, less caffeine and salt.	Gentle movement in the days before her period.	Prompts to seek help for severe mood symptoms or thoughts of self harm, with clear help information.
Trying to conceive	Fertile window, optional basal temperature, cervical mucus and ovulation test entries, and an intercourse log.	Folate, iron and protein rich foods.	Moderate, steady activity and no overtraining.	Prompts to see a doctor after the usual time of trying, as set by a doctor.

3.8 Pipeline: planned for later

These are not in the current build. Please include an effort estimate for each and note any dependency on existing work.

Area	Feature	Status	Tier	What it does	Developer directory: current standing
Across	Privacy lock and discreet mode	Pipeline	Free	PIN or fingerprint lock, neutral notification text, and the ability to export or delete her data.	
Across	Urdu and Roman Urdu	Pipeline	Free	The whole app, including insights and messages, in Urdu and Roman Urdu.	

Area	Feature	Status	Tier	What it does	Developer directory: current standing
Hormones	Gentle red flag guidance	Pipeline	Free	Rule based prompts that tell her when it is worth seeing a doctor, for example a very late period twice in a row or very heavy flow, linked to the doctor PDF. Wording must be reviewed by a doctor.	
Nutrition	Ramadan mode	Pipeline	Plus	Suhoor and iftar plans, gentler workouts, and a way to mark missed fasts against the cycle.	
Across	Health Connect sync	Pipeline	Plus	Pulls steps, sleep and heart rate from her phone or watch so she does not have to log them.	
Hormones	Lab report upload	Pipeline	Plus, or a one time purchase	She uploads results such as thyroid, vitamin D, iron and blood sugar and gets a plain language explanation with a trend over time. Wording must be reviewed by a doctor.	
Hormones	Cycle calendar with a plan ahead	Pipeline	Plus	Shows the coming phases with what to eat and how to train, so she can plan her month.	
Movement	Micro sessions	Pipeline	Plus	Short 5 minute sessions such as cramp relief, stress breathing, gentle stretch and a low energy walk. Filmed once.	
Movement	Cycle synced 30 day challenges	Pipeline	Active	Community challenges built around the phases of the	

Area	Feature	Status	Tier	What it does	Developer directory: current standing
				cycle.	
Across	Gift a subscription and mother and daughter plan	Pipeline	Paid tiers	She can buy a plan for someone else, or add a family member on a shared plan.	
Across	Group plans for workplaces and universities	Pipeline	Separate	Bulk subscriptions sold to organizations, with simple admin for the organization.	

Part 4. AI features that improve revenue

Feature	How it improves revenue
Free daily check-in and logging	Builds the daily habit and the data that makes Plus insights worth paying for.
AI meal photo logging with a free cap	Free users reach the cap and see the upgrade prompt to Plus. It also raises daily engagement.
Personalized AI phase insights	The main reason to pay for Plus. Free users see a locked sample.
Symptom pattern analyzer and weekly report	A Plus feature, with a teaser for free users when a pattern is found.
Doctor ready PDF export	Part of Plus, or a one time purchase. Gating should be a setting we can change.
Phase based nudge notifications	Builds habit, brings back lapsed users and supports renewals.
Weekly progress summary	Shows value each week, which reduces churn at renewal.
AI diet plan, grocery list and food scoring	Make Plus useful every day, so users stay subscribed longer.
AI generated workouts and recovery workouts	Give Plus users daily movement without a trainer, and keep them active after a missed session.
Enhanced streaks and tone and style personalization	Make the app feel built for her, which lifts retention.
Condition modules	Each module opens a new audience and gives that audience a reason to choose Plus.
AI nutritionist	A clear reason to move up to Unlimited.
Referral program	Brings in new users at a lower cost than paid ads.
In app and website ads	Direct income from free users and website visitors.
Human trainer 1:1 booking	Per session income on top of the subscription.
Pipeline: Ramadan mode, lab reports, gift plans and group plans	A yearly reason to subscribe, a paid add on, and new sales channels.

Part 5. Do not build

Arthritis module, WhatsApp AI coach, WhatsApp nutrition Q&A, conversational AI trainer, AI voice guided sessions, camera based form correction, effort estimate before a session, watch together scheduling, offline class packs. Anything not listed in Part 3 is out of scope unless we confirm in writing.

Part 6. How to build it, and what we need from you

- Keep cost per user low. Use plain rules for predictable decisions, such as phase to intensity or symptoms to a rest day suggestion. Generate AI content in scheduled batches for groups of similar users and store it. Use live per user AI only where the output must be unique, such as the AI nutritionist.
- Logging must be fast. Every log should take a few taps, and the quick daily check-in should take under half a minute.
- Build condition modules as configuration, using the eight components in 3.7.1. The food, workout and safety rules in 3.7.2 to 3.7.5 are our starting point. We will have them reviewed by a qualified doctor or dietitian before release, so keep them easy to edit without a new app release.
- First send the findings list from the APK review in Part 1, together with the filled Developer directory column.
- Then send an effort and cost estimate for every feature in Part 3, a proposed build order with dependencies, and confirmation of what already exists for each Partly built and To confirm item so we agree on what remains.
- For Pipeline items in 3.7 and 3.8, send an effort estimate only. Do not build them until we confirm.
- Still to be decided on our side: when automatic weekly adjustment of the diet plan is scheduled.
