FitHer

UI Improvement Recommendations

A focused, evidence based UI critique only. Every item below is tied to a screen I actually observed. I have not included anything that requires backend, analytics, or product strategy assumptions.

1. What already works well in the UI (preserve these)

Before listing problems, these are the UI decisions worth protecting:

- **Consistent card system** rounded corners, soft shadows, consistent padding across Home, Diet, Progress, Reports, Plans. This is the strongest part of the design language.
- **Consistent primary CTA style** full width green buttons on every conversion screen. Users always know what the **main** action is.
- **Stable bottom navigation** Home / Workout / Diet / Progress / Community. Same order every time.
- **Toast + UNDO pattern** (Screenshot 15) "**Lunch logged as Skipped**" with an Undo action is a genuinely good micro interaction. Keep it.
- **Meal action sheet** (Screens 12, 14) clean, three option hierarchy (Followed / Alternative / Skipped), reason chips underneath. Excellent pattern.
- **Notification settings screen** (Screenshot 30) well organized toggle list with title + description per row. One of the cleanest screens in the app.
- **Dark green plan cards** (Screens 19, 20) create a strong visual anchor and read as "**premium**"
- **Cycle wheel** (Screenshot 2) distinctive, memorable, on brand.

2. High-priority UI problems (fix first)

2.1 — Two modals stacked on top of each other

Screen: 5 (Day 7 Review + Book Your First Consultation)
Problem: The "Day 7 Review" bottom sheet and the "Book your first consultation" sheet render simultaneously, with the booking sheet on top. The user cannot complete the review while the booking prompt is open.
UI fix: Enforce single modal at a time. Sequence them: Day 7 Review → dismiss → then show consultation prompt. Never allow two bottom sheets to coexist.

2.2 Floating action buttons overlap content and bottom nav

Screens: 6, 10, 31, 35 (camera + WhatsApp style FABs)
Problem: Two circular FABs sit in the bottom-right corner, overlapping the "Meals" card on Home and the bottom nav on other screens. They also stack at slightly different vertical offsets across screens.
UI fix: Choose one FAB, not two. Either:

- Move the chat FAB into the top app bar as a support icon, OR
- Merge both actions into a single expandable FAB, OR
- Position a single FAB above the bottom nav with a consistent 16dp margin.
Severity: HIGH — visual clutter + accidental taps.

2.3 Red used for a non-destructive action

Screen: 18 (Notifications "Mark All Read")
Problem: The button uses an alarm red that reads as destructive or dangerous. Marking notifications as read is benign.
UI fix: Change to a neutral secondary style (outlined or soft gray-green). Reserve red for actual destructive actions only (Cancel plan, Delete post).
Severity: MEDIUM signals wrong intent.

2.4 Greeting bug rendered to the user

Screen: 8 / 33 ("Hi last")
Problem: The greeting pulls the user's last name or a placeholder value ("last"). This is both a copy bug and a UI polish failure — the greeting is one of the first things users see on the Diet tab.
UI fix: Fall back gracefully (first name → username → "Hi there"). Never render "last" as a name.
Severity: HIGH trust erosion at a daily-touch screen.

2.5 Logo spelling inconsistency (FITHER vs FitHer)

Screens: 1, 3, 4, 21
Problem: The in-app logo reads "FITHER" (all caps, with a stylized H), but the product is referred to as "FitHer" everywhere else including the app store listing and marketing. The wordmark styling also makes the "H" ambiguous.
UI fix: Pick one canonical logo treatment. If the styled "FITHER" is the brand mark, ensure it reads as "FitHer" at small sizes. Re-test at 24px, 32px, 48px.
Severity: MEDIUM brand recall and store-listing consistency.

3. Information hierarchy & density

3.1 Home screen has too many modules in one viewport

Screen: 6
Problem: Ten distinct modules render on one scroll — cycle banner, class card, class carousel, AI insight, mood row, water, sleep, hormones, weight, calories, cycle ring, meals summary. Each competes for attention. There is no single "primary" action for the day.
UI fix:
- Choose **one hero module** (the currently-relevant class, or the AI insight).
- Move water / sleep / hormones / weight / calories into a single horizontal swipeable stat strip.
- Keep only 2–3 modules above the fold.
Severity: HIGH decision paralysis reduces daily engagement.

3.2 Symptom percentages are unlabeled

Screen: 35 (Symptoms This Month)
Problem: Rows read "Bloated 40% / 35%," "Energy 60% / 78%," etc., with no label explaining what the two numbers mean. A user cannot interpret this at a glance.
UI fix: Add a column header ("This month · Last month") or inline labels. Consider converting to a small trend arrow + single percentage.
Severity: HIGH comprehension failure on a data screen.

3.3 Weight entry is slider-only

Screen: 16
Problem: The weight modal uses a 40–150 kg slider with no numeric input. A user weighing 98.0 kg must drag a slider across ~110 values. Precision is difficult, and users who dislike dragging have no alternative.
UI fix: Add a numeric text field or a numeric keypad beneath the slider. Keep the slider as a visual aid, not the only input. Also add a kg/lb toggle if the target market expects it.
Severity: HIGH daily-use friction.

3.4 Plan cards look identical

Screen: 20 (Our Plans)
Problem: All three plan cards use the same dark-green header, same layout, same CTA, and near-identical feature bullets. There is no visual signal of which plan is recommended, most popular, or best value.
UI fix:
- Add a "Most Popular" ribbon to the recommended plan.
- Differentiate plan headers by icon color and outcome label.
- Show price savings on longer durations.
- Make the "Workout Plan only" card visually lighter (fewer checkmarks) to signal a smaller tier.

Severity: HIGH directly affects plan selection and ARPU.

4. Typography, color, and contrast

4.1 Small labels in pale gray

Screens: 6, 9, 11, 19, 31 (labels like "Morning · until 11:00," "50m · moderate," "Week 1 · 0/7")
Problem: Secondary text is set in very light gray on cream. On a low-brightness phone or in daylight, this will fail contrast guidelines (likely below 4.5:1).
UI fix: Darken secondary text by 15–20%. Verify against WCAG AA at the actual pixel sizes used.
Severity: MEDIUM accessibility + readability.

4.2 Cycle wheel segment labels are tiny

Screen: 2

Problem: "MENSTRUAL," "LUTEAL," "FOLLICULAR," "OVULATION" are set at very small sizes inside the wheel. Combined with pale segment colors, this is hard to read on a small device.
UI fix: Increase label size by at least 2pt, and consider moving labels outside the ring with leader lines.
Severity: MEDIUM.

4.3 Time labels on Schedule are cramped

Screens: 7, 17, 31
****Problem:** "03:00 AM," "05:00 AM," etc. sit in a narrow left column at small size. The "AM/PM" wraps to a second line, making the timeline feel cluttered.
UI fix: Use 24-hour format for the Pakistani market (no AM/PM wrap), or move time inside the class card as a right-aligned label.
Severity: MEDIUM.

4.4 Status chip colors have no legend

Screens: 11, 15 (Pending / Skipped / Logged), 19 (ACTIVE)
Problem: Chips use pale green, pale gray, and pale red without an obvious semantic mapping. Users must learn the meaning by trial.
UI fix: Standardize chips into a small palette (green = done, amber = pending, gray = skipped, red = missed) and use the same mapping everywhere.
Severity: LOW MEDIUM

5. Empty states and states of "nothing"

5.1 Photo Library empty state is bare

Screen: 37
Problem: Two gray placeholder tiles with "+" icons. No illustration, no copy, no explanation of why a user should add photos.
UI fix: Add a small illustration and a one-line prompt ("Track your progress with weekly photos"). Compare to Screen 38's reply empty state, which does this well — reuse that pattern.
Severity: MEDIUM.

5.2 Progress screen shows 0 for everything

Screen: 9
Problem: On a new account, the screen shows empty rings, "0" values, and empty charts. There is no "getting started" state to guide the first action.
UI fix: Add a first-run state "Log your first workout to start tracking" with a single CTA. Only show the full dashboard once the user has 1–2 data points.
Severity: MEDIUM.

5.3 Payment error appears while picker is open

Screen: 26 (Upload Slip)

Problem: The error toast "Please select an image first!" appears over the Camera/Gallery picker before the user has had a chance to select anything. This is both a bug and a UI state-management issue.
UI fix: Only show the error after the picker is dismissed without a selection, and anchor the message inside the upload card — not as a floating toast.
Severity: CRITICAL (revenue path).

6. Micro-interactions and feedback

6.1 No visible loading or success states

Screens: Payment flow (22–26), consultation booking (34), post publishing (39)
Problem: None of these screens show a loading spinner, a confirmation state, or a success transition after the primary CTA is tapped. Users cannot tell if their action registered.
UI fix: Add a loading state to every primary CTA (button becomes spinner, form disables), and a clear success confirmation screen or modal after payment, booking, and posting.
Severity: HIGH abandonment risk on slow networks (relevant for Pakistan).

6.2 Save button in "Why did you skip?" appears disabled

Screen: 14
Problem: The Save button renders in a lighter, less saturated green than other primary CTAs. It is unclear whether it is disabled until a reason is chosen.
UI fix: Either make it visibly disabled (grayed + no shadow) or visibly enabled. Avoid the ambiguous middle state.
Severity: LOW MEDIUM.

6.3 "Mark All Read" timestamps all say "just now"

Screen: 18
Problem: Every notification shows the same timestamp. Either this is a demo account artifact or a real UI issue with relative-time rendering.
UI fix: Confirm and fix relative-time rendering. Show absolute time after 24h.
Severity: MEDIUM.

7. Navigation and IA polish

7.1 "Login as Team / Admin" on the public sign-in screen

Screen: 4
Problem: A privileged role entry point sits directly under the normal user sign-in. Visually it looks like a normal option.
UI fix: Move it to a hidden long-press on the logo, a deep link, or a separate URL. Never expose an admin entry visually on the consumer login screen.
Severity: MEDIUM trust + security optics.

7.2 Bottom nav "Workout" ring shows "0-0"

Screens: 31, 35 (bottom nav)
Problem: The Workout tab has a small activity ring showing "0-0" unclear what the two numbers represent.
UI fix: Either label them, or replace them with a single completion indicator.
Severity: LOW.

7.3 "Meals: coming soon" placeholder

Screens: 9, 35
Problem: A "coming soon" label sits next to a live meal-logging feature. Confusing signal.
UI fix: Remove the placeholder until the feature ships, or label it "Recipe library — coming soon" to clarify.
Severity: LOW.

8. Consistency fixes (quick wins)

Issue	Screen	Fix
"Aasma" vs "Asma" vs "DR Asma"	8, 19, 20, 21, 33, 34	One canonical spelling everywhere
Workout and Dietplan From (Asma)" vs "(Aasma)"	19 vs 20	Same string in both places
Date formats : 25/09/2026 vs 2026-09-25 vs 25/03/2026	24, 29, 34, 36	One format per surface, one source of truth
"Hi last" greeting	8, 33	Fallback logic
"Day 13 of 7"	8,13	Counter logic
FITHER vs FitHer logo	1, 3, 4, 21	Single wordmark
Benefit chips read as medical claims ("Early Detection")	21	Reword to fitness outcomes (unless clinically defensible)
Workout-only plan lists "customized diet plan" bullet	20	Remove the bullet from the workout-only tier
